Revision History Table

Revision	Date	Revised Content
01	August, 2018	Original Release

1. Expression

1.1 Types

Different data types of variable can be declared in Variables Manager

byte	8bit interger	unsigned	0 to 255	significant digit 3
int	32bit interger	signed	-2147483648 to 2147483647	significant digit 10
float	32bit float number	signed	-3.40282e+038f to 3.40282e+038f	significant digit 7
double	64bit float number	signed	-1.79769e+308 to 1.79769e+308	significant digit 15
bool	booling		true or false	
string	string			

For int type variable, both int16 and int32 are supported. The default type is int 32

int16	16bit interger	signed	-32768 to 32767	significant digit 5
int32	32bit interger	signed	-2147483648 to 2147483647	significant digit 10

1.2 Variables and Constants

1. Variables

In the naming rule of variables, only the numbers, under line and the upper case and lower case English charactors are supported.

Numbers 0123456789

Charactors a-z, A-Z, _

Example

int i = 0

string s = "ABC"

string s1 = "DEF"

string s2 = "123"

When utilizing variables, double quotation marks shall not be applied as shown below:

s = s1 + " and " + s2 // s = "DEF and 123"

 // s, s1, s2 are variable, and " and " is a string.

When using constant, including number, string, and booling value, only sting shall double quotation marks be applied to.

2. Numbers

- Decimal integer, decimal float number, binary, hexadecimal integer and scientific notation are supported.

Decimal integer	123
	-123
	+456
Decimal float	34.567
	-8.9
Binary	0b0000111
	0B1110000
Hexadecimal integer	0x123abc
	0X00456DEF
Scientific notation	3.4e5
	2.3E-4

- For binary and Hexadecimal notation, there is no float number.
- The notation of number is not case sensitive.

For example:

0b0011 equals to 0B0011
0xabcD equals to 0XABCD, 0xABCd, 0Xabcd etc
3.4e5 equals to 3.4E5

- The transforming between float number and byte array may cause discrepancy in value

For example:

float 5.317302E+030 → float to byte[] {0x72,0x86,0x3A,0x42}
byte[] {0x72,0x86,0x3A,0x43} → byte[] to float 5.317302E+030

- Byte can only present unsigned numbers from 0 to 255. As a result, if negative number is assigned to byte type variable directly or through calculation, only 8 bit unsigned value will be kept.

For example:

```
byte b = -100 // b = 156 // -100 is present as 0xFFFFF9C by 16bit notation.  
// Because byte can only keep 8 bit data, that is 0x9C (156), b will equals to 156
```

3. String

When inputing string constant, double quotation marks shall be placed in pairs around the string to avoid

the recognition error of variable and string. °

For example

"Hello World! "

"Hello TM""5" (If " is one of the character in the string, use two ("") in stead of one (").

- Control charactor in double quation mark is not supported.

For example:

"Hello World!\r\n" (the output would be **Hello World!\r\n** string)

- Without double quotation marks, the compiling will follows the rules below
 1. Numbers will be view as numbers
 2. The combination of numbers and charactors will be view as variable as long as the variable does exist.
 3. If the variable does not exist, it will be compiled as string with warning message.
- The combination of string and variable

1. Inside double quotation marks, variables will not be combiled as variables

For example:

```
s = "TM5"           // s = "TM5"
s1 = "Hi, s Robot"  // s1 = "Hi, s Robot"
```

2. To input the combination of variables and strings, double quotation marks needs to be placed around the string, and plus sign (+) shall be used to link variables and numbers

Example:

```
s1 = "Hi, " + s + " Robot"  // s1 = "Hi, TM5 Robot"
```

3. To be compatible with the old version software, the single quotation marks can be placed around the variables , but a warning message will be send out

For example:

```
single quotation marks  "Hi, 's' Robot"           // s1 = "Hi, TM5 Robot"
                        "Hi, 'x' Robot"           // s1 = "Hi, 'x' Robot" // Because variable x does not exist, 'x' is viewed as
string
```

4. Single quotation marks can not be presented by "'". If the users would like to input '(variable name)', the standard format with double quation marks should be used.

For example

```
"Hi, 's' Robot"           // s1 = "Hi, TM5 Robot"
```

// If s1 = "Hi, 's' Robot" is what you want, please use the following syntax.

"Hi, " + "s" + " Robot" // s1 = "Hi, 's' Robot"

- For control character, e.g. new line, please use Ctrl() command.

For example

s1 = "Hi, " + Ctrl("\r\n") + s + " Robot" or "Hi, " + NewLine + s + " Robot"

Hi,

TM5 Robot

- Reserved characters is similar to variables, no double quotation marks is needed. (But single quotation mark is not supported)
 1. empty empty string, equals to ""
 2. newline 或 NewLine new line, equals to Ctrl("\r\n") or Ctrl(0x0D0A)

4. Boolean

True or false value of logic.

Represent true value true

True

Represent false value false

False

The Boolean value is case sensitive. If the eligal notation is applied, it will beviewed as variable or string.

1.3 Array

- Array is a set of data with the same data type. The initial value is assigned with {}, and every element remains the characteristic of its data type.

For example

```
int[] i = {0,1,2,3}           // elements in number data type
string[] s = {"ABC", "DEF", "GHI"} // elements in string data type
bool[] bb = {true, false, true} // elements in boolean data type
```

- By utilizing index, the value of specified element can be get, the index is start from 0

For example

index	0	1	2	3	4	5	6	7
array								
	A[0]	A[1]	A[2]	A[3]	A[4]	A[5]	A[6]	A[7]

eight elements in total

Valid index values [0] .. [7], an error will occur with invalid index number.

- Only one degree array is supported. The maximum index number is 2048.
- The array size is dynamic, which may alter according to the return value of functions or assigned values. The maximum element number is 2048. This feature make array meets the needs of different funtions and applications in Network Node.

For Example:

```
string[] ss = {empty, empty, empty} // The initial size of string array is 3 elements
ss = String_Split("A_B_C_D_F_G_H", "_") // After splitting string, the string array has 7 elements
len = Length(ss) // len = 7
ss = String_Split("A,B", ",") // After splitting string, the string array has 2 elements
len = Length(ss) // len = 2
```

1.4 Operator Symbols

- The operator table is listed below.
- The calculation follows the precedence of operator first then the associativity.

For example

left-to-right associativity

A = A * B / C % D → (A = (((A * B) / C) % D))

right-to-left associativity

Precedence High to low	Operator	Name	Example	Requirement	associativity
17	++	Postfix increment	i++	Integer	left-to-right
	--	Postfix decrement	i--	variable	
	()	Function call	int x = f()		
	[]	Allocate storage	array[4] = 2	Array variable	
16	++	Prefix increment	++i	Integer	right-to-left
	--	Prefix decrement	--i	variable	
	+	Unary plus	int i = +1	Numeric	
	-	Unary minus	int i = -1	variable, Constant	
	!	Logical negation (NOT)	if (!done) ...	Boolean	
	~	Bitwise NOT	flag1 = ~flag2	Integer	
14	*	Multiplication	int i = 2 * 4	Numeric	left-to-right
	/	Division	float f = 10.0 / 3.0	variable,	
	%	Modulo (integer	int rem = 4 % 3	Constant	
13	+	Addition	int i = 2 + 3	Numeric	
	-	Subtraction	int i = 5 - 1	variable, Constant	
12	<<	Bitwise left shift	int flags = 33 << 1	Integer	
	>>	Bitwise right shift	int flags = 33 >> 1	variable, Constant	
11	<	Less than	if (i < 42) ...	Numeric	
	<=	Less than or equal to	if (i <= 42) ...	variable,	
	>	Greater than	if (i > 42) ...	Constant	
	>=	Greater than or equal to	if (i >= 42) ...		
10	==	Equal to	if (i == 42) ...		
	!=	Not equal to	if (i != 42) ...		
9	&	Bitwise AND	flag1 = flag2 & 42	Integer	
8	^	Bitwise XOR	flag1 = flag2 ^ 42	variable,	
7		Bitwise OR	flag1 = flag2 42	Constant	

6	&&	Logical AND	if (conditionA && conditionB)		
5		Logical OR	if (conditionA conditionB)		
4	c ? t : f	Ternary conditional	int i = a > b ? a : b		right-to-left
3	=	Basic assignment	int a = b	Left side: Numeric variable Right side: Numeric variable, Constant	
	+=	Addition assignment	a += 3		
	-=	Subtraction assignment	b -= 4		
	*=	Multiplication assignment	a *= 5		
	/=	Division assignment	a /= 2		
	%=	Modulo assignment	a %= 3		
	<<=	Bitwise left shift assignment	flags <<= 2	Left side: Integer variable Right side: Integer variable, Constant	
	>>=	Bitwise right shift assignment	flags >>= 2		
	&=	Bitwise AND assignment	flags &= new_flags		
	^=	Bitwise XOR assignment	flags ^= new_flags		
=	Bitwise OR assignment	flags = new_flags			

1.5 Warning

A warning message will be send out, under the condition listed below.

- Double quotation marks does not placed around the string constant.
- There is single quotation marks inside the string constant.
- When assigning float value to integer constant, some digits may get lost

For example

```
int i = 1.234    // warning i = 1
float f = 1.234
i = f           // warning i = 1
```

- When assigning value to variables with fewer digits, some digits may get lost

For example

```
byte b = 100
int i = 1000
float f = 1.234
double d = 2.345
b = i           // warning b = 232    // byte can contain values from 0 to 255
f = d           // warning f = 2.345
```

- When assigning string value to numeric variable, a conversion from string to number will be applied. If the conversion is executable, a warning message will be send out, or the project will be stopped by error.

For example

```
int i = "1234"           // warning i = 1234
int j = "0x89AB"         // warning j = 35243
int k = "0b1010"         // warning k = 10
string s1 = 123           // warning s1 = 123 // Number to string
string s2 = "123"
int x = s2                // warning // string to number
// The following code can be compiled with warning, but will be stopped by error when executing.
S2 = "XYZ"
x = s2                    // warning // Stop executing by error// s = "XYZ" cannot be converted to number
s2 = ""
x = s2                    // warning // Stop executing by error// s = "" cannot be converted to number
```

- String parameters is used as numeric parameters in functions.

For example

```
Ctrl(0x0A0B0C0D0E)    // warning // 0x0A0B0C0D0E is not int type (over 32bit)  
                        // Because there is another syntax, Ctrl(string), the parameter would  
                        be applied to Ctrl(string)
```

Although the project can still be executed with warning message, correcting all the errors in warning message is highly recommended, which can eliminate unpredictable problems and prevent the project being stopped by errors.

2. Functions

2.1 Byte_ToInt16()

Transforms the first two bytes of the assigned byte array to integer, and returns in int type.

Syntax 1

```
int Byte_ToInt16(  
    byte[],  
    int,  
    int  
)
```

Parameters

<code>byte[]</code>	Byte array
<code>int</code>	Byte array follows the Little Endian or Big Endian
0	Little Endian (Default)
1	Big Endian
<code>int</code>	Transfer to signed int16 (Signed Number) or unsigned int16 (Unsigned Number)
0	signed int16 (Default)
1	unsigned int16

Return

`int` A signed or unsigned int16 formed by 2 bytes beginning at index [0].
Because only 2 bytes is needed, the index of byte array will be [0][1]. If the data is not long enough, it would be filled to 2 bytes before transforming.

Note

`byte[] bb1 = {0x90, 0x01, 0x05}`

`byte[] bb2 = {0x01}` // Cause bb2[] does not fill 2 bytes. It would be filled to 2 bytes before transforming.

```
value = Byte_ToInt16(bb1, 0, 0) // 0x0190 value = 400  
value = Byte_ToInt16(bb1, 0, 1) // 0x0190 value = 400  
value = Byte_ToInt16(bb1, 1, 0) // 0x9001 value = -28671  
value = Byte_ToInt16(bb1, 1, 1) // 0x9001 value = 36865  
value = Byte_ToInt16(bb2, 0, 0) // 0x0001 value = 1  
value = Byte_ToInt16(bb2, 0, 1) // 0x0001 value = 1  
value = Byte_ToInt16(bb2, 1, 0) // 0x0100 value = 256  
value = Byte_ToInt16(bb2, 1, 1) // 0x0100 value = 256
```

Syntax 2

```
int Byte_ToInt16(  
    byte[],  
    int  
)
```

Note

Similar to Syntax 1 with return value as signed int16

Byte_ToInt16(bb1, 0) => **Byte_ToInt16**(bb1, 0, 0)

Syntax 3

```
int Byte_ToInt16(  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input and return value as signed int16

Byte_ToInt16(bb1) => **Byte_ToInt16**(bb1, 0)

2.2 *Byte_ToInt32()*

Transform the first four bytes of byte array to integer, and return in int type.

Syntax 1

```
int Byte_ToInt32 (  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array
`int` The input byte array follows Little Endian or Big Endian
 0 Little Endian (Default)
 1 Big Endian

Return

`int` A unsigned int32 formed by 4 bytes beginning at index [0].
Because only 4 bytes is needed, the index of byte array will be [0][1][2][3]. If the data is not long enough, it would be filled to 4 bytes before transforming.

Note

`byte[] bb1 = {0x01, 0x02, 0x03, 0x4F, 1}`

`byte[] bb2 = {0x01, 0x02, 0x03}` // Cause bb2[] does not fill 4 bytes. It would be filled to 4 bytes before transforming.

`value = Byte_ToInt32(bb1, 0) // 0x4F030201 value = 1325597185`

`value = Byte_ToInt32(bb1, 1) // 0x0102034F value = 16909135`

`value = Byte_ToInt32(bb2, 0) // 0x00030201 value = 197121`

`value = Byte_ToInt32(bb2, 1) // 0x01020300 value = 16909056`

Syntax 2

```
int Byte_ToInt32 (  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input

`Byte_ToInt32(bb1) => Byte_ToInt32(bb1, 0)`

2.3 Byte_ToFloat()

Transform the first four bytes of byte array to float number, and return in float type.

Syntax 1

```
float Byte_ToFloat(  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array
`int` The input byte array follows Little Endian or Big Endian
0 Little Endian (Default)
1 Big Endian

Return

`float` A floating-point number formed by 4 bytes beginning at index [0].
Because only 4 bytes is needed, the index of byte array will be [0][1][2][3]. If the data is not long enough, it would be filled to 4 bytes before transforming.

Note

`byte[] bb1 = {0x01, 0x02, 0x03, 0x4F, 1}`

`byte[] bb2 = {0x01, 0x02, 0x03}` // Cause bb2[] does not fill 4 bytes. It would be filled to 4 bytes before transforming.

`value = Byte_ToFloat(bb1, 0) // 0x4F030201 value = 2.197947E+09`

`value = Byte_ToFloat(bb1, 1) // 0x0102034F value = 2.38796E-38`

`value = Byte_ToFloat(bb2, 0) // 0x00030201 value = 2.762254E-40`

`value = Byte_ToFloat(bb2, 1) // 0x01020300 value = 2.387938E-38`

Syntax 2

```
float Byte_ToFloat(  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input

`Byte_ToFloat(bb1) => Byte_ToFloat(bb1, 0)`

2.4 Byte_ToDouble()

Transform the first eight bytes of byte array to float number, and return in double type.

Syntax 1

```
double Byte_ToDouble (  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array
`int` The input byte array follows Little Endian or Big Endian
0 Little Endian (Default)
1 Big Endian

Return

`double` A floating-point number formed by 8 bytes beginning at index [0].
Because only 8 bytes is needed, the index of byte array will be [0][1][2][3][4][5][6][7]. If the data is not long enough, it would be filled to 8 bytes before transforming.

Note

`byte[] bb1 = {0x01, 0x02, 0x03, 0x4F, 1} // Cause bb1[] does not fill 8 bytes. It would be filled to 8 bytes before transforming.`

`byte[] bb2 = {0x01, 0x02, 0x03} // Cause bb1[] does not fill 8 bytes. It would be filled to 8 bytes before transforming.`

`value = Byte_ToDouble(bb1, 0) // 0x000000014F030201 value = 2.77692782029764E-314`

`value = Byte_ToDouble(bb1, 1) // 0x0102034F01000000 value = 8.20840179153173E-304`

`value = Byte_ToDouble(bb2, 0) // 0x00000000000030201 value = 9.73907141738724E-319`

`value = Byte_ToDouble(bb2, 1) // 0x0102030000000000 value = 8.20785244926136E-304`

Syntax 2

```
double Byte_ToDouble (  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input

Byte_ToDouble(bb1) => Byte_ToDouble(bb1, 0)

2.5 Byte_ToInt16Array()

Transform byte array to integer every 2 bytes, and return in int[] type.

Syntax 1

```
int[] Byte_ToInt16Array(  
    byte[],  
    int,  
    int  
)
```

Parameters

byte[] The input byte array

int The input byte array follows Little Endian or Big Endian

- 0 Little Endian (Default)
- 1 Big Endian

int Transfer to signed int16 (Signed Number) or unsigned int16 (Unsigned Number)

- 0 signed int16 (Default)
- 1 unsigned int16

Return

int[] A integer array formed by every 2 bytes of byte array beginning at index [0]

Note

byte[] bb1 = {0x90, 0x01, 0x02, 0x03, 0x04} // When the remaining part does not fill 2 byte, it would be filled to 2 bytes before transforming.

byte[] bb2 = {1, 2, 3, 4}

```
value = Byte_ToInt16Array(bb1, 0, 0) // {0x0190, 0x0302, 0x0004} value = {400, 770, 4}  
value = Byte_ToInt16Array(bb1, 0, 1) // {0x0190, 0x0302, 0x0004} value = {400, 770, 4}  
value = Byte_ToInt16Array(bb1, 1, 0) // {0x9001, 0x0203, 0x0400} value = {-28671, 515, 1024}  
value = Byte_ToInt16Array(bb1, 1, 1) // {0x9001, 0x0203, 0x0400} value = {36865, 515, 1024}
```

```
value = Byte_ToInt16Array(bb2, 0, 0) // {0x0201, 0x0403} value = {513, 1027}  
value = Byte_ToInt16Array(bb2, 0, 1) // {0x0201, 0x0403} value = {513, 1027}  
value = Byte_ToInt16Array(bb2, 1, 0) // {0x0102, 0x0304} value = {258, 772}  
value = Byte_ToInt16Array(bb2, 1, 1) // {0x0102, 0x0304} value = {258, 772}
```

Syntax 2

```
int[] Byte_ToInt16Array(  
    byte[],  
    int  
)
```

Note

Similar to Syntax 1 with return value as signed int16

Byte_ToInt16Array(bb1, 0) => Byte_ToInt16Array(bb1, 0, 0)

Syntax 3

```
int[] Byte_ToInt16Array(  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input and return value as signed int16

Byte_ToInt16Array(bb1) => Byte_ToInt16Array(bb1, 0)

2.6 *Byte_ToInt32Array()*

Transform byte array to integer every 4 bytes, and return in int[] type

Syntax 1

```
int[] Byte_ToInt32Array (  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The input byte array follows Little Endian or Big Endian

- 0 Little Endian (Default)
- 1 Big Endian

Return

`int[]` A integer array formed by every 4 bytes of byte array beginning at index [0]

Note

`byte[] bb1 = {0x01, 0x02, 0x03, 0x04, 0x05} // When the remaining part does not fill 4 byte, it would be filled to 4 bytes before transforming.`

`byte[] bb2 = {1, 2, 3, 4}`

`value = Byte_ToInt32Array(bb1, 0) // {0x04030201, 0x00000005} value = {67305985, 5}`

`value = Byte_ToInt32Array(bb1, 1) // {0x01020304, 0x05000000} value = {16909060, 83886080}`

`value = Byte_ToInt32Array(bb2, 0) // {0x04030201} value = {67305985}`

`value = Byte_ToInt32Array(bb2, 1) // {0x01020304} value = {16909060}`

Syntax 2

```
int[] Byte_ToInt32Array (  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input.

`Byte_ToInt32Array(bb1) => Byte_ToInt32Array(bb1, 0)`

2.7 Byte_ToFloatArray()

Transform byte array to integer every 4 bytes, and return in float[] type.

Syntax 1

```
float[] Byte_ToFloatArray(  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array
`int` The input byte array follows Little Endian or Big Endian
 0 Little Endian (Default)
 1 Big Endian

Return

`float[]` A floating-point number array formed by every 4 bytes of byte array beginning at index [0]

Note

`byte[] bb1 = {0x01, 0x02, 0x03, 0x04, 0x05}` // When the remaining part does not fill 4 byte, it would be filled to 4 bytes before transforming.

`byte[] bb2 = {1, 2, 3, 4}`

`value = Byte_ToFloatArray(bb1, 0)` // {0x04030201, 0x00000005} value = {1.53999E-36, 7.006492E-45}

`value = Byte_ToFloatArray(bb1, 1)` // {0x01020304, 0x05000000} value = {2.387939E-38, 6.018531E-36}

`value = Byte_ToFloatArray(bb2, 0)` // {0x04030201} value = {1.53999E-36}

`value = Byte_ToFloatArray(bb2, 1)` // {0x01020304} value = {2.387939E-38}

Syntax 2

```
float[] Byte_ToFloatArray(  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input

`Byte_ToFloatArray(bb1) => Byte_ToFloatArray(bb1, 0)`

2.8 Byte_ToDoubleArray()

Transform byte array to double every 8 bytes, and return in double[] type.

Syntax 1

```
double[] Byte_ToDoubleArray (  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array
`int` The input byte array follows Little Endian or Big Endian
0 Little Endian (Default)
1 Big Endian

Return

`double[]` A floating-point number array formed by every 8 bytes of byte array beginning at index [0]

Note

`byte[] bb1 = {0x01, 0x02, 0x03, 0x04, 0x05}` // When the remaining part does not fill 8 byte, it would be filled to 8 bytes before transforming.

`byte[] bb2 = {1, 2, 3, 4}` // When the remaining part does not fill 8 byte, it would be filled to 8 bytes before transforming.

```
value = Byte_ToDoubleArray(bb1, 0) // {0x0000000504030201} value = {1.06432325297744E-313}  
value = Byte_ToDoubleArray(bb1, 1) // {0x0102030405000000} value = {8.20788039849233E-304}  
value = Byte_ToDoubleArray(bb2, 0) // {0x0000000004030201} value = {3.32535749480063E-316}  
value = Byte_ToDoubleArray(bb2, 1) // {0x0102030400000000} value = {8.2078802626846E-304}
```

Syntax 2

```
double[] Byte_ToDoubleArray (  
    byte[]  
)
```

Note

Similar to Syntax 1 with little endian input

`Byte_ToDoubleArray(bb1) => Byte_ToDoubleArray(bb1, 0)`

2.9 Byte_ToString()

Transform byte array to string

Syntax 1

```
string Byte_ToString(  
    byte[],  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The character encoding rules applied to input byte array

- 0 UTF8 (Default) (0x00 END)
- 1 HEX BINARY
- 2 ASCII (0x00 END)

Return

`string` String formed by byte array. The transformation begins from index [0].

Note

`byte[] bb1 = {0x31, 0x32, 0x33, 0x00, 0x4F, 1}`

`byte[] bb2 = {0x01, 0x54, 0x4D, 0x35, 0xE6, 0xA9, 0x9F, 0xE5, 0x99, 0xA8, 0xE4, 0xBA, 0xBA}`

`value = Byte_ToString(bb1, 0) // value = "123" (UTF8 stop at 0x00)`

`value = Byte_ToString(bb1, 1) // value = "313233004F01"`

`value = Byte_ToString(bb1, 2) // value = "123" (ASCII stop at 0x00)`

`value = Byte_ToString(bb2, 0) // value = "\u01TM5\u4EBA" (UTF8)`

`value = Byte_ToString(bb2, 1) // value = "01544D35E6A99FE599A8E4BABA"`

`value = Byte_ToString(bb2, 2) // value = "\u01TM5?????????" (ASCII)`

* `\u01` represent the SOH control chractor, not the string value.

Syntax 2

```
string Byte_ToString(  
    byte[]  
)
```

Note

Similar to Syntax 1 with UTF8 character encoding rules

`Byte_ToString(bb1) => Byte_ToString(bb1, 0)`

2.10 Byte_Concat()

Concatenate two byte arrays, or concatenate one array with a byte value.

Syntax 1

```
byte[] Byte_Concat (  
    byte[],  
    byte  
)
```

Parameters

`byte[]` The input byte array
`byte` The byte value concatenated after the byte array

Return

`byte[]` The byte array formed by the input byte array and byte value

Note

`byte[] bb1 = {0x31, 0x32, 0x33, 0x00, 0x4F, 1}`

`value = Byte_Concat(bb1, 12) // value = {0x31, 0x32, 0x33, 0x00, 0x4F, 0x01, 0x0C}`

Syntax 2

```
byte[] Byte_Concat (  
    byte[],  
    byte[]  
)
```

Parameters

`byte[]` The input byte array1
`byte[]` The input byte array2, would be concatenated to the end of array1

Return

`byte[]` Byte array formed from concatenating input arrays.

Note

`byte[] bb1 = {0x31, 0x32, 0x33, 0x00, 0x4F, 1}`

`byte[] bb2 = {0x01, 0x02, 0x03}`

`value = Byte_Concat(bb1, bb2) // value = {0x31, 0x32, 0x33, 0x00, 0x4F, 0x01, 0x01, 0x02, 0x03}`

Syntax 3

```
byte[] Byte_Concat (  
    byte[],  
    byte[],  
    int  
)
```

Parameters

byte[]	The input byte array1
byte[]	The input byte array2, would be concatenated after the end of array1
int	The number of element in array2 to be concatenated
0..the length of array2	Valid number
<0	Invalid. Length of array2 will be applied instead.
> the length of array2	Invalid. Length of array2 will be applied instead.

Return

byte[] Byte array formed from concatenating input arrays.

Note

byte[] bb1 = {0x31, 0x32, 0x33, 0x00, 0x4F, 1}

byte[] bb2 = {0x01, 0x02, 0x03}

value = **Byte_Concat**(bb1, bb2, 2) // value = {0x31, 0x32, 0x33, 0x00, 0x4F, 0x01, 0x01, 0x02} // Concatenate only 2 elements from array2

value = **Byte_Concat**(bb1, bb2, -1) // value = {0x31, 0x32, 0x33, 0x00, 0x4F, 0x01, 0x01, 0x02, 0x03} // -1 is invalid value

value = **Byte_Concat**(bb1, bb2, 10) // value = {0x31, 0x32, 0x33, 0x00, 0x4F, 0x01, 0x01, 0x02, 0x03} // 10 exceeds the array size

// Length() can be utilized to acquire the array size

value = **Byte_Concat**(bb1, bb2, Length(bb2)) // value = {0x31, 0x32, 0x33, 0x00, 0x4F, 0x01, 0x01, 0x02, 0x03}

Syntax 4

```
byte[] Byte_Concat (  
    byte[],  
    int,  
    int,  
    byte[],  
    int,  
    int  
)
```

Parameters

byte[] The input byte array1

int The starting index of array1

0..(length of array1)-1 Valid

<0 The starting index would be 0

>=(length of array1) The starting index would be the length of array2 (For index over the length of array2, an empty value would be captured)

int The number of element in array1 to be concatenated

0.. (length of array1) Valid

<0 Invalid , length of array1 will be applied instead

>(length of array1) Invalid , length of array1 will be applied instead

If the total number of starting index and assigning elements exceeds the length of array1, the surplus index will be suspended.

byte[] The input byte array2 , would be concatenated after the end of array1

int The starting index of array2

0.. (length of array2)-1 Valid

<0 The starting index would be 0

>=(length of array2) The starting index would be the length of array2 (For index over the length of array2, an empty value would be captured)

int The number of element in array2 to be concatenated

0.. (length of array2) Valid

<0 Invalid. Length of array2 will be applied instead.

>(length of array2) Invalid. Length of array2 will be applied instead.

If the total number of starting index and assigning elements exceeds the length of array2, the surplus index will be suspended.

Return

byte[] Byte array formed from concatenating input arrays.

Note

byte[] bb1 = {0x31, 0x32, 0x33, 0x00, 0x4F, 1}

byte[] bb2 = {0x01, 0x02, 0x03}

value = **Byte_Concat**(bb1, 1, 3, bb2, 1, 2) // value = {0x32, 0x33, 0x00, 0x02, 0x03}

value = **Byte_Concat**(bb1, -1, 3, bb2, 3, -1) // value = {0x31, 0x32, 0x33}

2.11 String_ToInteger()

Transform string to integer (int type)

Syntax 1

```
int String_ToInteger (  
    string,  
    int  
)
```

Parameters

string The input string.

int The input string's notation is decimal, hexadecimal or binary

- 10 decimal or auto format detecting (Default)
- 16 hexadecimal
- 2 binary

String's notation

- 123 decimal
- 0x7F hexadecimal
- 0b101 binary

Return

int The integer value formed from input string. If notation is invalid, returns 0.

Note

```
value = String_ToInteger("1234", 10)    // value = 1234  
value = String_ToInteger("1234", 16)    // value = 4660  
value = String_ToInteger("1234", 2)     // value = 0      // Invalid binary format  
value = String_ToInteger("1100", 2)     // value = 12  
value = String_ToInteger("0x1234", 10)  // value = 4660  // Hexadecimal format by auto detecting  
value = String_ToInteger("0x1234", 16)  // value = 4660  
value = String_ToInteger("0x1234", 2)   // value = 0      // Invalid binary format  
value = String_ToInteger("0b1100", 10)  // value = 12    // Binary format by auto detecting  
value = String_ToInteger("0b1100", 16)  // value = 725248 // Valid Hexadecimal number  
value = String_ToInteger("0b1100", 2)   // value = 12  
  
value = String_ToInteger("+1234", 10)   // value = 1234  
value = String_ToInteger("-1234", 10)   // value = -1234  
value = String_ToInteger("-0x1234", 16) // value = 0      // Invalid  
value = String_ToInteger("-0b1100", 2)  // value = 0      // Invalid
```

Syntax 2

```
int String_ToInteger (
    string
)
```

Note

Similar to syntax1 with decimal format or auto format detection

String_ToInteger(str) => String_ToInteger(str, 10)

Syntax 3

```
int[] String_ToInteger (
    string[],
    int
)
```

Parameters

<code>string[]</code>	Input string array
<code>int</code>	The notation of element in input string array is decimal, hexadecimal or binary
10	decimal or auto format detecting (Default)
16	hexadecimal
2	binary
String's notation	
123	decimal
0x7F	hexadecimal
0b101	binary
* The notation of all the elements in a single array has to be identical	

Return

`int[]` The integer array formed from input string array. If notation is invalid, returns 0.

Note

```
ss = {"12", "ab", "cc", "dd", "10"}
value = String_ToInteger(ss)           // value = {12, 0, 0, 0, 10} // "ab","cc","dd" are invalid decimal numbers
value = String_ToInteger(ss, 2)        // value = {0, 0, 0, 0, 2}  // "12","ab","cc","dd" are invalid binary numbers
value = String_ToInteger(ss, 16)       // value = {18, 171, 204, 221, 16}
value = String_ToInteger(ss, 10)       // value = {12, 0, 0, 0, 10} // "ab","cc","dd" are invalid decimal numbers
```

2.12 String_ToFloat()

Transform string to float number (float type)

Syntax 1

```
float String_ToFloat(  
    string,  
    int  
)
```

Parameters

<code>string</code>	Input string
<code>int</code>	Input string's notation is decimal, hexadecimal or binary format
10	decimal or auto format detecting (Default)
16	hexadecimal
2	binary
	String's notation
123	decimal
0x7F	hexadecimal
0b101	binary

Return

`float` The floating-point number formed from input string. If notation is invalid, returns 0.

Note

<code>value = String_ToFloat("12.34", 10)</code>	<code>// value = 12.34</code>
<code>value = String_ToFloat("12.34", 16)</code>	<code>// value = 0 // Invalid hexadecimal format</code>
<code>value = String_ToFloat("12.34", 2)</code>	<code>// value = 0 // Invalid binary format</code>
<code>value = String_ToFloat("11.00", 2)</code>	<code>// value = 0 // Invalid binary format</code>
<code>value = String_ToFloat("0x1234", 10)</code>	<code>// value = 6.530051E-42 // Hexadecimal format by auto detecting</code>
<code>value = String_ToFloat("0x1234", 16)</code>	<code>// value = 6.530051E-42</code>
<code>value = String_ToFloat("0x1234", 2)</code>	<code>// value = 0 // Invalid binary format</code>
<code>value = String_ToFloat("0b1100", 10)</code>	<code>// value = 1.681558E-44 // Binary format by auto detecting</code>
<code>value = String_ToFloat("0b1100", 16)</code>	<code>// value = 1.016289E-39 // Valid hexadecimal format</code>
<code>value = String_ToFloat("0b1100", 2)</code>	<code>// value = 1.681558E-44</code>
<code>value = String_ToFloat("+12.34", 10)</code>	<code>// value = 12.34</code>
<code>value = String_ToFloat("-12.34", 10)</code>	<code>// value = -12.34</code>
<code>value = String_ToFloat("-0x1234", 16)</code>	<code>// value = 0 // Invalid format</code>
<code>value = String_ToFloat("-0b1100", 2)</code>	<code>// value = 0 // Invalid format</code>

Syntax 2

```
float String_ToFloat(  
    string  
)
```

Note

Similar to syntax1 with decimal format or auto format detection

String_ToFloat(str) => String_ToFloat(str, 10)

Syntax 3

```
float[] String_ToFloat(  
    string[],  
    int  
)
```

Parameters

<code>string[]</code>	Input string array
<code>int</code>	The notation of elements in input string array is decimal, hexadecimal or binary
10	decimal or auto format detecting (Default)
16	hexadecimal
2	binary
String's notation	
123	decimal
0x7F	hexadecimal
0b101	binary
* The notation of all the elements in a single array has to be identical	

Return

`float[]` The floating-point number array formed from input string array. If notation is invalid, returns 0.

Note

```
ss = {"12.345", "ab", "cc", "dd", "10.111"}  
value = String_ToFloat(ss)           // value = {12.345, 0, 0, 0, 10.111}  
value = String_ToFloat(ss, 2)        // value = {0, 0, 0, 0, 0}  
value = String_ToFloat(ss, 16)       // value = {0, 2.39622E-43, 2.858649E-43, 3.09687E-43, 0}  
value = String_ToFloat(ss, 10)       // value = {12.345, 0, 0, 0, 10.111}
```

2.13 String_ToDouble()

Transform string to float number (double type)

Syntax 1

```
double String_ToDouble(  
    string,  
    int  
)
```

Parameters

<code>string</code>	Input string
<code>int</code>	Input string's notation is decimal, hexadecimal or binary format
10	decimal or auto format detecting (Default)
16	hexadecimal
2	binary
	String's notation
123	decimal
0x7F	hexadecimal
0b101	binary

Return

`double` The floating-point number formed from input string. If notation is invalid, returns 0.

Note

```
value = String_ToDouble("12.34", 10)    // value = 12.34  
value = String_ToDouble("12.34", 16)    // value = 0      // Invalid hexadecimal format  
value = String_ToDouble("12.34", 2)     // value = 0      // Invalid binary format  
value = String_ToDouble("11.00", 2)     // value = 0      // Invalid binary format  
value = String_ToDouble("0x1234", 10)   // value = 2.30234590962021E-320 // Hexadecimal format by auto  
detecting  
value = String_ToDouble("0x1234", 16)   // value = 2.30234590962021E-320  
value = String_ToDouble("0x1234", 2)   // value = 0      // Invalid binary format  
value = String_ToDouble("0b1100", 10)   // value = 5.92878775009496E-323 // Binary format by auto  
detecting  
value = String_ToDouble("0b1100", 16)   // value = 3.58320121515072E-318 // Valid hexadecimal format  
value = String_ToDouble("0b1100", 2)   // value = 5.92878775009496E-323  
  
value = String_ToDouble("+12.34", 10)   // value = 12.34  
value = String_ToDouble("-12.34", 10)   // value = -12.34  
value = String_ToDouble("-0x1234", 16)  // value = 0      // Invalid format
```

```
value = String_ToDouble("-0b1100", 2)    // value = 0    // Invalid format
```

Syntax 2

```
double String_ToDouble(  
    string  
)
```

Note

Similar to syntax1 with decimal format or auto format detection

String_ToDouble(str) => String_ToDouble(str, 10)

Syntax 3

```
double[] String_ToDouble(  
    string[],  
    int  
)
```

Parameters

<code>string[]</code>	Input string array
<code>int</code>	The notation of elements in input string array is decimal, hexadecimal or binary
10	decimal or auto format detecting (Default)
16	hexadecimal
2	binary
String's notation	
123	decimal
0x7F	hexadecimal
0b101	binary
* The notation of all the elements in a single array has to be identical	

Return

`double[]` The floating-point number array formed from input string array. If notation is invalid, returns 0.

Note

```
ss = {"12.345", "ab", "cc", "dd", "10.111"}  
value = String_ToDouble(ss)           // value = {12.345, 0, 0, 0, 10.111}  
value = String_ToDouble(ss, 2)        // value = {0, 0, 0, 0, 0}  
value = String_ToDouble(ss, 16)       // value = {0, 8.44852254388532E-322, 1.00789391751614E-321, 1.09188507730915E-321, 0}  
value = String_ToDouble(ss, 10)       // value = {12.345, 0, 0, 0, 10.111}
```

2.14 String_ToByte()

Transform string to byte array

Syntax 1

```
byte[] String_ToByte (  
    string,  
    int  
)
```

Parameters

string Input string

int The character encoding rules applied to input string

- 0 UTF8 (Default)
- 1 HEX BINARY // Stop at invalid Hex value
- 2 ASCII

Return

byte[] The byte array formed from input string

Note

```
value = String_ToByte("12345", 0) // value = {0x31, 0x32, 0x33, 0x34, 0x35}  
value = String_ToByte("12345", 1) // value = {0x12, 0x34, 0x50} // the insufficient part will be filled  
                                // with 0  
value = String_ToByte("12345", 2) // value = {0x31, 0x32, 0x33, 0x34, 0x35}  
value = String_ToByte("0x12345", 0) // value = {0x30, 0x78, 0x31, 0x32, 0x33, 0x34, 0x35}  
value = String_ToByte("0x12345", 1) // value = {0x00} // Only 0 be transformed, cause x is an  
                                // invalid Hex value  
value = String_ToByte("0x12345", 2) // value = {0x30, 0x78, 0x31, 0x32, 0x33, 0x34, 0x35}  
value = String_ToByte("TM5機器人", 0) // value = {0x54, 0x4D, 0x35, 0xE6, 0xA9, 0x9F, 0xE5, 0x99, 0xA8, 0xE4, 0xBA, 0xBA}  
value = String_ToByte("TM5機器人", 1) // value = {0x00} // T is an invalid Hex value  
value = String_ToByte("TM5機器人", 2) // value = {0x54, 0x4D, 0x35, 0x3F, 0x3F, 0x3F}  
  
value = String_ToByte("0123456", 1) // value = {0x01, 0x23, 0x45, 0x60}  
value = String_ToByte("01234G5", 1) // value = {0x01, 0x23, 0x40} // G is an invalid Hex value
```

Syntax 2

```
byte[] String_ToByte (  
    string  
)
```

Note

Similar to syntax1 with UTF8 format

String_ToByte(str) => **String_ToByte**(str, 0)

2.15 String_IndexOf()

Reports the zero-based index of the first occurrence of a specified string

Syntax 1

```
int String_IndexOf (  
    string,  
    string  
)
```

Parameters

string Input string

string The specified string to be searched. The zero-based index of the first occurrence is to be found.

Return

int	0..(Length of string)-1	If the specified string is found, returns the index number
	-1	Not found
	0	The specified string is "" or empty

Note

value = String_IndexOf("012314", "1")	// value = 1
value = String_IndexOf("012314", "")	// value = 0
value = String_IndexOf("012314", empty)	// value = 0
value = String_IndexOf("012314", "d")	// value = -1
value = String_IndexOf("", "d")	// value = -1

2.16 String_LastIndexOf()

Reports the zero-based index position of the last occurrence of a specified string

Syntax 1

```
int String_LastIndexOf(  
    string,  
    string  
)
```

Parameters

`string` Input string

`string` The specified string to be searched. The zero-based index of the last occurrence is to be found.

Return

<code>int</code>	<code>0..(Length of string)-1</code>	If the specified string is found, returns the index number
	<code>-1</code>	Not found
	<code>0</code>	The specified string is "" or empty

Note

value = `String_LastIndexOf("012314", "1")` // value = 4

value = `String_LastIndexOf("012314", "")` // value = 5

value = `String_LastIndexOf("012314", empty)` // value = 5

value = `String_LastIndexOf("012314", "d")` // value = -1

value = `String_LastIndexOf("", "d")` // value = -1

2.17 String_Substring()

Retrieves a substring from input string

Syntax 1

```
string String_Substring(  
    string,  
    int,  
    int  
)
```

Parameters

`string` Input string
`int` The starting character position of sub string (0 .. (length of input string)-1)
`int` The length of substring

Return

`string` Substring
If `starting character position < 0`, returns empty string
If `starting character position >= length of input string`, returns empty string
If `length of substring < 0`, the substring ends at the last character of the input string
If the sum of starting character position and length of substring exceeds the length of input string, the substring ends at the last character of the input string

Note

```
value = String_Substring("0x12345", 2, 4)    // value = "1234"  
value = String_Substring("0x12345", -1, 4)   // value = ""  
value = String_Substring("0x12345", 7, 4)    // value = ""  
value = String_Substring("0x12345", 2, -1)   // value = "12345"  
value = String_Substring("0x12345", 2, 100)  // value = "12345"
```

Syntax 2

```
string String_Substring(  
    string,  
    int  
)
```

Note

Similar to syntax1 with the substring ends at the last character of the input string

`String_Substring(str, 2) => String_Substring(str, 2, maxlen)`

Syntax 3

```
string String_Substring(  
    string,  
    string,  
    int  
)
```

Parameters

`string` Input string

`string` The target string to be searched, the substring will start at its position, if it is found

`int` The length of substring

Return

`string` Substring

If [the target string is empty](#), the substring starts at index zero

If [the target string is not found](#), returns empty string

If [length of substring < 0](#), the substring ends at the last character of the input string

If the sum of starting character position and length of substring exceeds the length of input string, the substring ends at the last character of the input string

Note

This syntax is the same as `String_Substring(str, String_IndexOf(str1), int)`

```
value = String_Substring("0x12345", "1", 4)    // value = "1234"  
value = String_Substring("0x12345", "", 4)     // value = "0x12"  
value = String_Substring("0x12345", "7", 4)    // value = ""  
value = String_Substring("0x12345", "1", -1)   // value = "12345"  
value = String_Substring("0x12345", "1", 100)  // value = "12345"
```

Syntax 4

```
string String_Substring(  
    string,  
    string  
)
```

Note

Similar to Syntax 3 with the substring ends at the last character of the input string

`String_Substring(str, "1") => String_Substring(str, "1", maxlen)`

Syntax 5

```
string String_Substring(  
    string,  
    string,  
    string,  
    int  
)
```

Parameters

`string` Input string
`string` Prefix. The leading element of the substring
`string` Suffix. The trailing element of the substring
`int` The number of occurrence

Return

`string` Substring
If `prefix` and `suffix` are empty string, returns input string
If `the number of occurrence` ≤ 0 , returns empty string

Note

```
value = String_Substring("0x12345", "", "", 0)           // value = "0x12345"  
value = String_Substring("0x12345", "1", "4", 1)         // value = "1234"  
value = String_Substring("0x12345", "1", "4", 2)         // value = ""  
value = String_Substring("0x12345", "1", "4", 0)         // value = ""  
value = String_Substring("0x123450x12-345", "1", "4", 1)  // value = "1234"  
value = String_Substring("0x123450x12-345", "1", "4", 2)  // value = "12-34"  
value = String_Substring("0x123450x12-345", "1", "4", 3)  // value = ""  
value = String_Substring("0x12345122", "1", "", 1)        // value = "12345122" // All the character after  
prefix  
value = String_Substring("0x12345122", "1", "", 2)        // value = "122"  
value = String_Substring("0x12345122", "1", "", 4)        // value = ""  
value = String_Substring("0x12345433", "", "4", 1)        // value = "0x123454" // All the character before  
suffix  
value = String_Substring("0x12345433", "", "4", 2)        // value = "0x1234"
```

Syntax 6

```
string String_Substring(  
    string,  
    string,  
    string  
)
```

Note

Similar to Syntax 5 with the substring start at the first occurrence

String_Substring(str, prefix, suffix) => **String_Substring**(str, prefix, suffix, 1)

2.18 String_Split()

Splits the string using specified separator.

Syntax 1

```
string[] String_Split(  
    string,  
    string,  
    int  
)
```

Parameters

- `string` Input string
- `string` Separator (String)
- `int` Format
 - 0 Split and keep the empty strings
 - 1 Split and eliminate the empty strings
 - 2 Split with the elements inside double quotation mark skipped, and keep the empty strings
 - 3 Split with the elements inside double quotation mark skipped, and eliminate the empty strings

Return

`string[]` Splitted substring
If input string is empty, return substring have only one element. [0] = empty
If separator is empty, return substring have only one element. [0] = Input string

Note

```
value = String_Split("0x112345", "1", 0)    // value = {"0x", "", "2345"}  
value = String_Split("0x112345", "", 0)     // value = {"0x112345"}  
value = String_Split("0x112345", "1", 1)    // value = {"0x", "2345"}  
s1 = "123, ""456,67"",89"  
value = String_Split(s1, ",", 0)            // value = {"123", ""456", "67"", "89"} // length = 4  
value = String_Split(s1, ",", 2)            // value = {"123", ""456,67"", "89"}   // length = 3
```

Syntax 2

```
string[] String_Split(  
    string,  
    string  
)
```

Note

Similar to Syntax1 with splitting and keeping the empty strings

String_Split(str, separator) => **String_Split**(str, separator, 0)

2.19 String_Replace()

Returns a new string in which all occurrences of a specified string in the input string are replaced with another specified string

Syntax 1

```
string String_Replace(  
    string,  
    string,  
    string  
)
```

Parameters

`string` Input string

`string` Old value, the string to be replaced

`string` New value, the string to replace all occurrences of old value

Return

`string` The string formed by replacing the old value with new value in input value. If the old value is empty, returns the input string

Note

value = **String_Replace**("0x112345", "1", "2") // value = "0x222345"

value = **String_Replace**("0x112345", "", "2") // value = "0x112345"

value = **String_Replace**("0x112345", "1", "") // value = "0x2345"

2.20 String_Trim()

Returns a new string in which all leading and trailing occurrences of specified characters or white-space characters from the input string are removed

Syntax 1

```
string String_Trim(  
    string  
)
```

Parameters

`string` Input string

Return

`string` String formed by removing all leading and trailing occurrences of white-space characters

Note

```
value = String_Trim("0x112345 ") // value = "0x112345"  
value = String_Trim(" 0x112345") // value = "0x112345"  
value = String_Trim(" 0x112345 ") // value = "0x112345"
```

White-space characters

\u0020	\u1680	\u2000	\u2001	\u2002	\u2003	\u2004
\u2005	\u2006	\u2007	\u2008	\u2009	\u200A	\u202F
\u205F	\u3000					
\u2028						
\u2029						
\u0009	\u000A	\u000B	\u000C	\u000D	\u0085	\u00A0
\u200B	\uFEFF					

Syntax 2

```
string String_Trim(  
    string,  
    string  
)
```

Parameters

`string` Input string

`string` Specified characters to be removed from leading occurrences

Return

`string` String formed by removing all leading occurrences of specified characters

Syntax 3

```
string String_Trim(  
    string,  
    string,  
    string  
)
```

Parameters

`string` Input string

`string` Specified characters to be removed from leading occurrences

`string` Specified characters to be removed from trailing occurrences

Return

`string` String formed by removing all leading and trailing occurrences of the specified characters

Note

```
string s1 = "Hello  Hello  World  Hello  World"  
string s2 = "HelloHelloWorldHelloWorld"  
value = String_Trim(s1, "Hello")           // value = "  Hello  World  Hello  World"  
value = String_Trim(s1, "World")           // value = "Hello  Hello  World  Hello  World"  
value = String_Trim(s1, "", "Hello")       // value = "Hello  Hello  World  Hello  World"  
value = String_Trim(s1, "", "World")       // value = "Hello  Hello  World  Hello  "  
value = String_Trim(s1, "Hello", "World")  // value = "  Hello  World  Hello  "  
value = String_Trim(s2, "Hello")           // value = "WorldHelloWorld"  
value = String_Trim(s2, "World")           // value = "HelloHelloWorldHelloWorld"  
value = String_Trim(s2, "", "Hello")       // value = "HelloHelloWorldHelloWorld"  
value = String_Trim(s2, "", "World")       // value = "HelloHelloWorldHello"  
value = String_Trim(s2, "Hello", "World")  // value = "WorldHello"
```

2.21 String_ToLower()

Change all the character in string to lower case

Syntax 1

```
string String_ToLower (  
    string  
)
```

Parameters

`string` Input string

Return

`string` The string formed by converting all the English character into lower case. Non-English character will be remained the same.

Note

```
value = String_ToLower("0x11Acz34")    // value = "0x11acz34"
```

2.22 String_ToUpper()

Change all the character in string to upper case

Syntax 1

```
string String_ToUpper (  
    string  
)
```

Parameters

`string` Input string

Return

`string` The string formed by converting all the English character into upper case. Non-English character will be remained the same.

Note

```
value = String_ToUpper("0x11Acz34")    // value = "0X11ACZ34"
```

2.23 Array_Equals()

Determines whether the specified two arrays are identical

Syntax 1

```
bool Array_Equals (  
    ?[],  
    ?[]  
)
```

Parameters

?[] Input array1 (Data type can be byte, int, float, double, bool, string)
?
?[] Input array2 (Data type can be byte, int, float, double, bool, string)
* The data type of array1 and array2 must be identical.

Return

bool Two arrays are identical or not?
true two arrays are identical
false two arrays are not identical

Syntax 2

```
bool Array_Equals (  
    ?[], vv  
    int,  
    ?[],  
    int,  
    int  
)
```

Parameters

?[] Input array1 (Data type can be byte, int, float, double, bool, string)
int The starting index of array1 (0 .. (length of array1)-1)
?
?[] Input array2 (Data type can be byte, int, float, double, bool, string)
int The starting index of array2 (0 .. (length of array2)-1)
int The number of elements to be compared (0: return true)
* The data type of array1 and array2 must be identical.

Return

bool The assigned elements in two arrays are identical or not?

`true` identical
`false` not identical (or parameters are not valid)

Note

```
? byte[] n1 = {100, 200, 30}
byte[] n2 = {100, 200, 30}
Array_Equals(n1, n2) // true
Array_Equals(n1, 0, n2, 0, 3) // true
Array_Equals(n1, 0, n2, 0, Length(n2)) // true

? int[] n1 = {1000, 2000, 3000}
int[] n2 = {1000, 2000, 3000, 4000}
Array_Equals(n1, n2) // false
Array_Equals(n1, 0, n2, 0, Length(n2)) // false // compare 4 elements
Array_Equals(n1, 0, n2, 0, 3) // true

? float[] n1 = {1.1, 2.2, 3.3}
float[] n2 = {1.1, 2.2}
Array_Equals(n1, n2) // false
Array_Equals(n1, 0, n2, 0, Length(n2)) // true // compare 2 elements
Array_Equals(n1, 0, n2, 0, Length(n1)) // false

? double[] n1 = {100, 200, 300, 3.3, 2.2, 1.1}
double[] n2 = {100, 200, 400, 3.3, 2.2, 4.4}
Array_Equals(n1, n2) // false
Array_Equals(n1, 0, n2, 0, Length(n2)) // false
Array_Equals(n1, 0, n2, 0, 2) // true
Array_Equals(n1, 3, n2, 3, 2) // true

? bool[] n1 = {true, false, true, true, true}
bool[] n2 = {true, false, true, false, true}
Array_Equals(n1, n2) // false
Array_Equals(n1, 0, n2, 0, -1) // false
Array_Equals(n1, 0, n2, 0, 0) // true // compare 0 element

? string[] n1 = {"123", "ABC", "456", "DEF"}
string[] n2 = {"123", "ABC", "456", "DEF"}
Array_Equals(n1, n2) // true
```

Array_Equals(n1, -1, n2, 0, 4)

// false

// Invalid starting index

2.24 Array_IndexOf()

Searches for the specified element and returns the index of its first occurrence in the input array

Syntax 1

```
int Array_IndexOf (  
    ?[],  
    ?  
)
```

Parameters

- ?[] input array (Data type can be byte, int, float, double, bool, string)
- ? The target element to search (The data type needs to be the same as the input array ?[], but not an array)

Return

- int 0..(length of input array)-1 If the element is found , returns the index value
- 1 No element found

Note

- ? byte[] n = {100, 200, 30}
value = Array_IndexOf(n, 200) // 1
value = Array_IndexOf(n, 2000) // error // 2000 is not byte data
- ? int[] n = {1000, 2000, 3000}
value = Array_IndexOf(n, 200) // -1
- ? float[] n = {1.1, 2.2, 3.3}
value = Array_IndexOf(n, 1.1) // 0
- ? double[] n = {100, 200, 300, 3.3, 2.2, 1.1}
value = Array_IndexOf(n, 1.1) // 5
- ? bool[] n = {true, false, true, true, true}
value = Array_IndexOf(n, true) // 0
- ? string[] n = {"123", "ABC", "456", "DEF"}
value = Array_IndexOf(n, "456") // 2

2.25 Array_LastIndexOf()

Searches for the specified element and returns the index of the last occurrence within the entire Array.

Syntax 1

```
int Array_LastIndexOf(  
    ?[],  
    ?  
)
```

Parameters

- ?[] input array (Data type can be byte, int, float, double, bool, string)
- ? The target element to search (The data type needs to be the same as the input array ?[], but not an array)

Return

```
int    0..(length of input array)-1  If the element is found , returns the index value  
      -1                             No element found
```

Note

- ? **byte[]** n = {100, 200, 30}
value = **Array_LastIndexOf**(n, 200) // 1
value = **Array_LastIndexOf**(n, 2000) // error // 2000 is not byte data
- ? **int[]** n = {1000, 2000, 3000}
value = **Array_LastIndexOf**(n, 200) // -1
- ? **float[]** n = {1.1, 2.2, 3.3}
value = **Array_LastIndexOf**(n, 1.1) // 0
- ? **double[]** n = {100, 200, 300, 3.3, 2.2, 1.1}
value = **Array_LastIndexOf**(n, 1.1) // 5
- ? **bool[]** n = {true, false, true, true, true}
value = **Array_LastIndexOf**(n, true) // 4
- ? **string[]** n = {"123", "ABC", "456", "DEF"}
value = **Array_LastIndexOf**(n, "456") // 2

2.26 Array_Reverse()

Reverses the sequence of the elements in the array

Syntax 1

```
? [] Array_Reverse (  
    ? []  
)
```

Parameters

? [] input array (Data type can be byte, int, float, double, bool, string)

Return

? [] The reversed array

Note

```
? byte[] n = {100, 200, 30}  
n = Array_Reverse(n)      // n = {30, 200, 100}  
  
? int[] n = {1000, 2000, 3000}  
n = Array_Reverse(n)      // n = {3000, 2000, 1000}  
  
? float[] n = {1.1, 2.2, 3.3}  
n = Array_Reverse(n)      // n = {3.3, 2.2, 1.1}  
  
? double[] n = {100, 200, 300, 3.3, 2.2, 1.1}  
n = Array_Reverse(n)      // n = {1.1, 2.2, 3.3, 300, 200, 100}  
  
? bool[] n = {true, false, true, true, true}  
n = Array_Reverse(n)      // n = {true, true, true, false, true}  
  
? string[] n = {"123", "ABC", "456", "DEF"}  
n = Array_Reverse(n)      // n = {"DEF", "456", "ABC", "123"}
```

Syntax 2

```
?[] Array_Reverse (  
    ?[],  
    int  
)
```

Parameters

?[] input array (Data type can be byte, int, float, double, bool, string)

int the number of elements to be viewed as a section to be reversed

2 2 elements as a section

4 4 elements as a section

8 8 elements as a section

* The sequence of the elements in the same section will be reversed, but the sequence of the sections will remain the same

Return

?[] The reversed array

Note

? byte[] n = {100, 200, 30}

```
n = Array_Reverse(n, 2)    // n = {200, 100, 30}    // 2 elements as a section, that is {100,200}{30}  
n = Array_Reverse(n, 4)    // n = {30, 200, 100}    // 4 elements as a section, that is {100,200,30}  
n = Array_Reverse(n, 8)    // n = {30, 200, 100}
```

? int[] n = {100, 200, 300, 400}

```
n = Array_Reverse(n, 2)    // n = {200, 100, 400, 300}    // 2 elements as a section, that is {100,200}{300,400}  
n = Array_Reverse(n, 4)    // n = {400, 300, 200, 100}    // 4 elements as a section, that is {100,200,300,400}  
n = Array_Reverse(n, 8)    // n = {400, 300, 200, 100}
```

? float[] n = {1.1, 2.2, 3.3, 4.4, 5.5}

```
n = Array_Reverse(n, 2)    // n = {2.2, 1.1, 4.4, 3.3, 5.5}    // 2 elements as a section, that is {1.1,2.2}{3.3,4.4}{5.5}  
n = Array_Reverse(n, 4)    // n = {4.4, 3.3, 2.2, 1.1, 5.5}    // 4 elements as a section, that is {1.1,2.2,3.3,4.4}{5.5}  
n = Array_Reverse(n, 8)    // n = {5.5, 4.4, 3.3, 2.2, 1.1}
```

? double[] n = {100, 200, 300, 400, 4.4, 3.3, 2.2, 1.1, 50, 60, 70, 80}

```
n = Array_Reverse(n, 2)    // n = {200, 100, 400, 300, 3.3, 4.4, 1.1, 2.2, 60, 50, 80, 70}  
n = Array_Reverse(n, 4)    // n = {400, 300, 200, 100, 1.1, 2.2, 3.3, 4.4, 80, 70, 60, 50}  
n = Array_Reverse(n, 8)    // n = {1.1, 2.2, 3.3, 4.4, 400, 300, 200, 100, 80, 70, 60, 50}
```

? `bool[] n = {true, false, true, true, true, false, true, false}`

`n = Array_Reverse(n, 2) // n = {false, true, true, true, false, true, false, true }`

`n = Array_Reverse(n, 4) // n = {true, true, false, true, false, true, false, true}`

`n = Array_Reverse(n, 8) // n = {false, true, false, true, true, true, false, true}`

? `string[] n = {"123", "ABC", "456", "DEF", "000", "111"}`

`n = Array_Reverse(n, 2) // n = {"ABC", "123", "DEF", "456", "111", "000"}`

`n = Array_Reverse(n, 4) // n = {"DEF", "456", "ABC", "123", "111", "000"}`

`n = Array_Reverse(n, 8) // n = {"111", "000", "DEF", "456", "ABC", "123"}`

2.27 Array_Sort()

Sorts the elements in a array

Syntax 1

```
?[] Array_Sort(  
    [],  
    int  
)
```

Parameters

?[]	input array (Data type can be byte, int, float, double, bool, string)
int	Sorting direction
0	Ascending Order (Default)
1	Descending Order

Return

?[]	The array after sorting
-----	-------------------------

Syntax 2

```
?[] Array_Sort(  
    []  
)
```

Note

Similar to Syntax1 with sorting direction as ascending order

Array_Sort(array[]) => Array_Sort(array[], 0)

```
? int[] n = {1000, 2000, 3000}  
n = Array_Sort(n)           // n = {1000, 2000, 3000}  
  
? double[] n = {100, 200, 300, 3.3, 2.2, 1.1}  
n = Array_Sort(n, 1)        // n = {300, 200, 100, 3.3, 2.2, 1.1}  
  
? bool[] n = {true, false, true, true, true}  
n = Array_Sort(n, 1)        // n = {true, true, true, true, false}  
  
? string[] n = {"123", "ABC", "456", "DEF"}  
n = Array_Sort(n)           // n = {"123", "456", "ABC", "DEF"}
```

2.28 Array_SubElements()

Retrieves the sub-elements from input array

Syntax 1

```
?[] Array_SubElements (  
    ?[],  
    int,  
    int  
)
```

Parameters

?[]	Input array (Data type can be byte, int, float, double, bool, string)
int	The starting index of sub-elements. (0 .. (length of array)-1)
int	The number of element in sub-elements

Return

?[] The sub-elements from input arrays

If **starting index < 0**, sub-elements equals to empty array

If **starting index >= length of input array**, sub-elements equals to empty array

If **sub-element number < 0**, sub-elements starts at starting index to the last element of input array

If the sum of starting index and the number of element exceeds the length of the input array, sub-elements starts at starting index to the last element of input array

Syntax 2

```
?[] Array_SubElements (  
    ?[],  
    int  
)
```

Note

Similar to Syntax1, but the sub-elements starts at starting index to the last element of input array

Array_SubElements(array[], 2) => Array_SubElements(array[], 2, maxlen)

```
? byte[] n = {100, 200, 30}  
  
n1 = Array_SubElements(n, 0)      // n1 = {100, 200, 30}  
n1 = Array_SubElements(n, -1)     // n1 = {}  
n1 = Array_SubElements(n, 0, 3)   // n1 = {100, 200, 30}  
n1 = Array_SubElements(n, 1, 3)   // n1 = {200, 30}
```

```
n1 = Array_SubElements(n, 2)    // n1 = {30}
n1 = Array_SubElements(n, 3, 3) // n1 = {}
```

? **int[]** n = {1000, 2000, 3000}

```
n1 = Array_SubElements(n, 0)    // n1 = {1000, 2000, 3000}
n1 = Array_SubElements(n, -1)   // n1 = {}
n1 = Array_SubElements(n, 1, 3) // n1 = {2000, 3000}
n1 = Array_SubElements(n, 2)    // n1 = {3000}
```

? **float[]** n = {1.1, 2.2, 3.3}

```
n1 = Array_SubElements(n, 0)    // n1 = {1.1, 2.2, 3.3}
n1 = Array_SubElements(n, -1)   // n1 = {}
n1 = Array_SubElements(n, 1, 3) // n1 = {2.2, 3.3}
n1 = Array_SubElements(n, 2)    // n1 = {3.3}
```

? **double[]** n = {100, 200, 3.3, 2.2, 1.1}

```
n1 = Array_SubElements(n, 0)    // n1 = {100, 200, 3.3, 2.2, 1.1}
n1 = Array_SubElements(n, -1)   // n1 = {}
n1 = Array_SubElements(n, 1, 3) // n1 = {200, 3.3, 2.2}
n1 = Array_SubElements(n, 2)    // n1 = {3.3, 2.2, 1.1}
```

? **bool[]** n = {true, false, true, true, true}

```
n1 = Array_SubElements(n, 0)    // n1 = {true, false, true, true, true}
n1 = Array_SubElements(n, -1)   // n1 = {}
n1 = Array_SubElements(n, 1, 3) // n1 = {false, true, true}
n1 = Array_SubElements(n, 2)    // n1 = {true, true, true}
```

? **string[]** n = {"123", "ABC", "456", "DEF"}

```
n1 = Array_SubElements(n, 0)    // n1 = {"123", "ABC", "456", "DEF"}
n1 = Array_SubElements(n, -1)   // n1 = {}
n1 = Array_SubElements(n, 1, 3) // n1 = {"ABC", "456", "DEF"}
n1 = Array_SubElements(n, 2)    // n1 = {"456", "DEF"}
```

2.29 ValueReverse()

Reverse the sequence of byte units inside input data (int 2 bytes or 4 bytes, float 4 bytes, double 8 bytes); or reverse the sequence of character of string.

Syntax 1

```
int ValueReverse (  
    int,  
    int  
)
```

Parameters

int Input value

int The input value follows int32 or int16 format

0 int32 (Default)

1 int16. If the data does not meets int16 format, int32 will be applied instead.

2 int16. Forced to apply int16 format. For int32 data input, there could be some bytes missing

Return

int The value formed from reversing the sequence of byte units inside the input value. For Int32 data, reverse with 4 bytes. For int16 data, reverse with 2 bytes.

Note

int i = 10000

value = ValueReverse(i, 0) // 10000=0x00002710 → 0x10270000 // value = 270991360

value = ValueReverse(i, 1) // 10000=0x2710 → 0x1027 // value = 4135

i = 100000 // int32 數值

value = ValueReverse(i, 0) // 100000=0x000186A0 → 0xA0860100 // value = -1601830656

value = ValueReverse(i, 1) // 100000=0x000186A0 → 0xA0860100 // value = -1601830656

value = ValueReverse(i, 2) // 100000=0x000086A0 → 0xA0860000 // value = -24442

Syntax 2

```
int ValueReverse (  
    int  
)
```

Parameters

int Input value

Note

Similar to Syntax1 with int32 input format

ValueReverse(int) => **ValueReverse**(int, 0)

Syntax 3

```
float ValueReverse (  
    float  
)
```

Parameters

float Input value

Return

float The value formed from reversing the sequence of byte units inside the input value. For float data, reverse 4 bytes.

Note

float i = 40000

value = **ValueReverse**(i) // 40000=0x471C4000 → 0x00401C47 // value = 5.887616E-39

Syntax 4

```
double ValueReverse (  
    double  
)
```

Parameters

double Input value

Return

double The value formed from reversing the sequence of byte units inside the input value. For double data, reverse 8 bytes.

Note

double i = 80000

value = **ValueReverse**(i) // 80000=0x40F3880000000000 → 0x000000000088F340 // value = 4.43432217445369E-317

Syntax 5

```
string ValueReverse (  
    string  
)
```

Parameters

string Input string

Return

`string` The value formed from reversing the sequence of characters of input string.

Note

```
string i = "ABCDEF"
```

```
value = ValueReverse(i) // value = "FEDCBA"
```

Syntax 6

```
int[] ValueReverse (  
    int[],  
    int  
)
```

Parameters

`int[]` Input array value

`int` The input value follows int32 or int16 format

0 int32 (Default)

1 int16. If the data does not meets int16 format, int32 will be applied instead.

2 int16. Forced to apply int16 format. For int32 data input, there could be some bytes missing

Return

`int[]` The array formed from reversing the sequence of byte units inside every element of the input array.

Note

```
int[] i = {10000, 20000, 60000, 80000}
```

```
value = ValueReverse(i, 0) // value = {270991360, 541982720, 1625948160, -2143813376}
```

```
value = ValueReverse(i, 1) // value = {4135, 8270, 1625948160, -2143813376}
```

```
value = ValueReverse(i, 2) // value = {4135, 8270, 24810, -32712}
```

Syntax 7

```
int[] ValueReverse (  
    int[]  
)
```

Parameters

`int[]` Input array value

Note

Similar to Syntax6 with input integer as int32

```
ValueReverse(int[]) => ValueReverse(int[], 0)
```

Syntax 8

```
float[] ValueReverse (  
    float[]  
)
```

Parameters

`float[]` Input array value

Return

`float[]` The array formed from reversing the sequence of byte units inside every element of the input array.

Note

```
float[] i = {10000, 20000}
```

```
value = ValueReverse(i)      // value = {5.887614E-39, 5.933532E-39}
```

Syntax 9

```
double[] ValueReverse (  
    double[]  
)
```

Parameters

`double[]` Input array value

Return

`double[]` The array formed from reversing the sequence of byte units inside every element of the input array.

Note

```
double[] i = {10000, 20000}
```

```
value = ValueReverse(i)      // value = {4.42825109579759E-317, 4.43027478868296E-317}
```

Syntax 10

```
string[] ValueReverse (  
    string[]  
)
```

Parameters

`string[]` Input string array

Return

`string[]` The string array formed from reversing the string inside every element of the input string array.

Note

```
string[] i = {"ABCDEFGH", "12345678"}
```

```
value = ValueReverse(i)           // value = {"GFEDCBA", "87654321"}
```

2.30 GetBytes()

Convert arbitrary data type to byte array.

Syntax 1

```
byte[] GetBytes (
    ?,
    int
)
```

Parameters

? The input data. Data type can be int, float, double, bool, string or array.

int The input data follows Little Endian or Big Endian

0 Little Endian (Default)

1 Big Endian

Return

byte[] The byte array formed by input data

Syntax 2

```
byte[] GetBytes (
    ?
)
```

Note

Similar to Syntax1 with Little Endian

GetBytes(?) => GetBytes(?, 0)

? **byte** n = 100

value = **GetBytes**(n) // value = {0x64}

value = **GetBytes**(n, 0) // value = {0x64}

value = **GetBytes**(n, 1) // value = {0x64}

? **byte[]** n = {100, 200} // Convert every element of the array to byte, 1 byte as a single unit.

value = **GetBytes**(n) // value = {0x64, 0xC8}

value = **GetBytes**(n, 0) // value = {0x64, 0xC8}

value = **GetBytes**(n, 1) // value = {0x64, 0xC8}

? **int**

```
value = GetBytes(123456)      // value = {0x40, 0xE2, 0x01, 0x00}
value = GetBytes(123456, 0)   // value = {0x40, 0xE2, 0x01, 0x00}
value = GetBytes(0x123456, 0) // value = {0x56, 0x34, 0x12, 0x00}
value = GetBytes(0x1234561, 1) // value = {0x01, 0x23, 0x45, 0x61}
```

? **int[]** n = {10000, 20000, 80000} // Convert every single element of the array to byte. For int32 data, works on 4 bytes sequentially.

```
value = GetBytes(n)          // value = {0x10, 0x27, 0x00, 0x00, 0x20, 0x4E, 0x00, 0x00, 0x80, 0x38, 0x01, 0x00}
value = GetBytes(n, 0)        // value = {0x10, 0x27, 0x00, 0x00, 0x20, 0x4E, 0x00, 0x00, 0x80, 0x38, 0x01, 0x00}
value = GetBytes(n, 1)        // value = {0x00, 0x00, 0x27, 0x10, 0x00, 0x00, 0x4E, 0x20, 0x00, 0x01, 0x38, 0x80}
```

? **float**

```
value = GetBytes(123.456, 0)  // value = {0x79, 0xE9, 0xF6, 0x42}
float n = -1.2345
value = GetBytes(n, 0)        // value = {0x19, 0x04, 0x9E, 0xBF}
value = GetBytes(n, 1)        // value = {0xBF, 0x9E, 0x04, 0x19}
```

? **float[]** n = {1.23, 4.56, -7.89} // Convert every single element of the array to byte. For float data, works on 4 bytes sequentially.

```
value = GetBytes(n)          // value = {0xA4, 0x70, 0x9D, 0x3F, 0x85, 0xEB, 0x91, 0x40, 0xE1, 0x7A, 0xFC, 0xC0}
value = GetBytes(n, 0)        // value = {0xA4, 0x70, 0x9D, 0x3F, 0x85, 0xEB, 0x91, 0x40, 0xE1, 0x7A, 0xFC, 0xC0}
value = GetBytes(n, 1)        // value = {0x3F, 0x9D, 0x70, 0xA4, 0x40, 0x91, 0xEB, 0x85, 0xC0, 0xFC, 0x7A, 0xE1}
```

? **double** n = -1.2345

```
value = GetBytes(n, 0)        // value = {0x8D, 0x97, 0x6E, 0x12, 0x83, 0xC0, 0xF3, 0xBF}
value = GetBytes(n, 1)        // value = {0xBF, 0xF3, 0xC0, 0x83, 0x12, 0x6E, 0x97, 0x8D}
```

? **double[]** n = {1.23, -7.89} // Convert every single element of the array to byte. For double data, works on 8 bytes sequentially.

```
value = GetBytes(n)          // value = {0xAE, 0x47, 0xE1, 0x7A, 0x14, 0xAE, 0xF3, 0x3F, 0x8F, 0xC2, 0xF5, 0x28, 0x5C, 0x8F, 0x1F, 0xC0}
value = GetBytes(n, 0)        // value = {0xAE, 0x47, 0xE1, 0x7A, 0x14, 0xAE, 0xF3, 0x3F, 0x8F, 0xC2, 0xF5, 0x28, 0x5C, 0x8F, 0x1F, 0xC0}
value = GetBytes(n, 1)        // value = {0x3F, 0xF3, 0xAE, 0x14, 0x7A, 0xE1, 0x47, 0xAE, 0xC0, 0x1F, 0x8F, 0x5C, 0x28, 0xF5, 0xC2, 0x8F}
```

```

?  bool flag = true           // true is converted to 1 ; false is converted to 0
    value = GetBytes(flag)    // value = {1}
    value = GetBytes(flag, 0)  // value = {1}    // Because bool is 1 byte, Endian Parameters are not sufficient.
    value = GetBytes(flag, 1)  // value = {1}

?  bool[] flag = {true, false, true, false, false, true, true}
    value = GetBytes(flag)     // value = {1, 0, 1, 0, 0, 1, 1}
    value = GetBytes(flag, 0)  // value = {1, 0, 1, 0, 0, 1, 1}
    value = GetBytes(flag, 1)  // value = {1, 0, 1, 0, 0, 1, 1}

?  string n = "ABCDEFGH"       // string 使用 UTF8 轉換
    value = GetBytes(n)        // value = {0x41, 0x42, 0x43, 0x44, 0x45, 0x46, 0x47}
    value = GetBytes(n, 0)     // value = {0x41, 0x42, 0x43, 0x44, 0x45, 0x46, 0x47} // Endian Parameters not
                                sufficient
    value = GetBytes(n, 1)     // value = {0x41, 0x42, 0x43, 0x44, 0x45, 0x46, 0x47}

?  string[] n = {"ABC", "DEF", "達明機器人"}
    value = GetBytes(n)        // value = {0x41, 0x42, 0x43, 0x44, 0x45, 0x46,
                                0xE9, 0x81, 0x94, 0xE6, 0x98, 0x8E, 0xE6, 0xA9, 0x9F, 0xE5, 0x99, 0xA8, 0xE4, 0xBA, 0xBA}

```

Syntax 3

Convert integer (int type) to byte array.

```
byte[] GetBytes (  
    int,  
    int,  
    int  
)
```

Parameters

- | | |
|------------------|---|
| <code>int</code> | The input integer (int type) |
| <code>int</code> | The input value follows Little Endian or Big Endian |
| 0 | Little Endian (Default) |
| 1 | Big Endian |
| <code>int</code> | The input integer value's data type is int32 or int16 |
| 0 | int32 (Default) |
| 1 | int16. If the data does not meets int16 format, int32 will be applied instead. |
| 2 | int16. Forced to apply int16 format. For int32 data input, there could be some bytes missing. |

Return

- | | |
|---------------------|---|
| <code>byte[]</code> | The byte array formed by input integer. For int32 data, convert with 4 bytes. For int16 data, convert with 2 bytes. |
|---------------------|---|

Note

<code>value = GetBytes(12345, 0, 0)</code>	<code>// value = {0x39, 0x30, 0x00, 0x00}</code>
<code>value = GetBytes(12345, 0, 1)</code>	<code>// value = {0x39, 0x30}</code>
<code>value = GetBytes(12345, 0, 2)</code>	<code>// value = {0x39, 0x30}</code>
<code>value = GetBytes(0x123456, 0, 0)</code>	<code>// value = {0x56, 0x34, 0x12, 0x00}</code>
<code>value = GetBytes(0x123456, 0, 1)</code>	<code>// value = {0x56, 0x34, 0x12, 0x00}</code>
<code>value = GetBytes(0x123456, 0, 2)</code>	<code>// value = {0x56, 0x34} // bytes missing</code>
<code>value = GetBytes(0x1234561, 1, 0)</code>	<code>// value = {0x01, 0x23, 0x45, 0x61}</code>
<code>value = GetBytes(0x1234561, 1, 1)</code>	<code>// value = {0x01, 0x23, 0x45, 0x61}</code>
<code>value = GetBytes(0x1234561, 1, 2)</code>	<code>// value = {0x45, 0x61} // bytes missing</code>

Syntax 4

Convert the integer array (int[] type) to byte array

```
byte[] GetBytes (  
    int[],  
    int,  
    int  
)
```

Parameters

<code>int[]</code>	The input integer array (int[] type)
<code>int</code>	The input integer array follows Little Endian or Big Endian
0	Little Endian (Default)
1	Big Endian
<code>int</code>	The input integer array's data type is int32 or int16
0	int32 (Default)
1	int16. If the data does not meets int16 format, int32 will be applied instead
2	int16. Forced to apply int16 format. For int32 data input, there could be some bytes missing.

Return

`byte[]` The byte array formed by input integer array. Every element is converted independently and forms an array. For int32 data, convert with 4 bytes. For int16 data, convert with 2 bytes.

Note

```
i = {10000, 20000, 80000}  
value = GetBytes(i, 0, 0) // value = {0x10, 0x27, 0x00, 0x00, 0x20, 0x4E, 0x00, 0x00, 0x80, 0x38, 0x01, 0x00}  
value = GetBytes(i, 0, 1) // value = {0x10, 0x27, 0x20, 0x4E, 0x80, 0x38, 0x01, 0x00}  
value = GetBytes(i, 0, 2) // value = {0x10, 0x27, 0x20, 0x4E, 0x80, 0x38} // bytes missing  
value = GetBytes(i, 1, 0) // value = {0x00, 0x00, 0x27, 0x10, 0x00, 0x00, 0x4E, 0x20, 0x00, 0x01, 0x38, 0x80}  
value = GetBytes(i, 1, 1) // value = {0x27, 0x10, 0x4E, 0x20, 0x00, 0x01, 0x38, 0x80}  
value = GetBytes(i, 1, 2) // value = {0x27, 0x10, 0x4E, 0x20, 0x38, 0x80} // bytes missing
```

2.31 GetString()

Convert arbitrary data type to string

Syntax 1

```
string GetString(  
    ?,  
    int,  
    int  
)
```

Parameters

- | | |
|-------------------|--|
| ? | The input data. Data type can be int, float, double, bool, string or array. |
| int | The output string's notation is decimal, hexadecimal or binary (Can be only applied to hexadecimal or binary number) |
| 10 | decimal |
| 16 | hexadecimal |
| 2 | binary |
| String's notation | |
| 123 | decimal |
| 0x7F | hexadecimal |
| 0b101 | binary |
| int | The output string format (Can be only applied to hexadecimal or binary number) |
| 0 | Fill up digits. Add prefix 0x or 0b, e.g. 0x0C or 0b00001100 |
| 1 | Fill up digits. No prefix 0x or 0b, e.g. 0C or 00001100 |
| 2 | Don't fill up digits. Add prefix 0x or 0b, e.g. 0xC or 0b1100 |
| 3 | Don't fill up digits. No prefix 0x or 0b, e.g. C or 1100 |

Return

- | | |
|--------|--|
| string | String converted from input data. If the input data cannot be converted, returns empty string. If the input data is array, every element is converted respectively, and returned in "{ , , }" format |
|--------|--|

Syntax 2

```
string GetString(  
    ?,  
    int  
)
```

Similar to Syntax1 with filling up digits and adding prefix 0x or 0b.

GetString(?, 16) => GetString(?, 16, 0)

Syntax 3

```
string GetString(  
    ?  
)
```

Note

Similar to Syntax1 with decimal output, filling up digits and adding prefix.

GetString(?) => GetString(?, 10, 0)

? byte n = 123

```
value = GetString(n)           // value = "123"
value = GetString(n, 10)      // value = "123"
value = GetString(n, 16)      // value = "0x7B"
value = GetString(n, 2)       // value = "0b01111011"
value = GetString(n, 16, 3)   // value = "7B"
value = GetString(n, 2, 2)    // value = "0b1111011"
```

? `byte[] n = {12, 34, 56}`

```
value = GetString(n)           // value = "{12,34,56}"
value = GetString(n, 10)      // value = "{12,34,56}"
value = GetString(n, 16)      // value = "{0x0C,0x22,0x38}"
value = GetString(n, 2)       // value = "{0b00001100,0b00100010,0b00111000}"
value = GetString(n, 16, 3)   // value = "{C,22,38}"
value = GetString(n, 2, 2)    // value = "{0b1100,0b100010,0b111000}"
```

? `int n = 1234`

```
value = GetString(n)           // value = "1234"
value = GetString(n, 10)       // value = "1234"
value = GetString(n, 16)       // value = "0x000004D2"
value = GetString(n, 2)        // value = "0b00000000000000000000000010011010010"
value = GetString(n, 16, 3)    // value = "4D2"
value = GetString(n, 2, 2)     // value = "0b10011010010"
```

? **int[]** n = {123, 345, -123, -456}

```
value = GetString(n)           // value = "{123,345,-123,-456}"
value = GetString(n, 10)       // value = "{123,345,-123,-456}"
value = GetString(n, 16)       // value = "{0x0000007B,0x00000159,0xFFFFF85,0xFFFFFE38}"
value = GetString(n, 2)        // value = "{0b0000000000000000000000001111011,
                                     0b000000000000000000000000101011001,

```
value = GetString(n)           // value = "{true,false,true,false,false,true}"
value = GetString(n, 16)       // value = "{true,false,true,false,false,true}"
value = GetString(n, 2)        // value = "{true,false,true,false,false,true}"
value = GetString(n, 16, 3)    // value = "{true,false,true,false,false,true}"
```

? **string** n = "1234567890"

```
value = GetString(n)           // value = "1234567890"
value = GetString(n, 16)       // value = "1234567890"
value = GetString(n, 2)        // value = "1234567890"
value = GetString(n, 16, 3)    // value = "1234567890"
```

? **string[]** n = {"123.45", "345.67", "-12""3.48", "-45A6.79"}

```
value = GetString(n)           // value = "{123.45,345.67,-12""3.48,-45A6.79}" // -12""3.48 displayed as -12"3.48
value = GetString(n, 16)       // value = "{123.45,345.67,-12""3.48,-45A6.79}"
value = GetString(n, 2)        // value = "{123.45,345.67,-12""3.48,-45A6.79}"
value = GetString(n, 16, 3)    // value = "{123.45,345.67,-12""3.48,-45A6.79}"
```

Syntax 4

```
string GetString(  
    ?,  
    string,  
    int,  
    int  
)
```

Parameters

- ?** The input data. Data type can be int, float, double, bool, string or array.
- string** Separator for output string (Only effective to array input)
- int** The output string's notation is decimal, hexadecimal or binary (Can be only applied to hexadecimal or binary number)
- | | |
|----|-------------|
| 10 | decimal |
| 16 | hexadecimal |
| 2 | binary |
- String's notation
- | | |
|-------|-------------|
| 123 | decimal |
| 0x7F | hexadecimal |
| 0b101 | binary |
- int** The output string format (Can be only applied to hexadecimal or binary number)
- | | |
|---|---|
| 0 | Fill up digits. Add prefix 0x or 0b, e.g. 0x0C or 0b00001100 |
| 1 | Fill up digits. No prefix 0x or 0b, e.g. 0C or 00001100 |
| 2 | Don't fill up digits. Add prefix 0x or 0b, e.g. 0xC or 0b1100 |
| 3 | Don't fill up digits. No prefix 0x or 0b, e.g. C or 1100 |

Return

- string** String converted from input data. If the input data cannot be converted, returns empty string.
If the input data is array, every element is converted respectively, and returned as a string with the assigned separator

Syntax 5

```
string GetString(  
    ?,  
    string,  
    int  
)
```

Note

Similar to Syntax4 with filling up digits and adding prefix 0x or 0b

GetString(?, str, 16) => GetString(?, str, 16, 0)

Syntax 6

```
string GetString(  
    ?,  
    string  
)
```

Note

Similar to Syntax4 with decimal output, filling up digits and adding prefix

GetString(?, str) => GetString(?, str, 10, 0)

? **byte** n = 123

```
value = GetString(n)           // value = "123"  
value = GetString(n, ";", 10)   // value = "123"  
value = GetString(n, "-", 16)   // value = "0x7B"  
value = GetString(n, "#", 2)    // value = "0b01111011"  
value = GetString(n, ",", 16, 3) // value = "7B"  
value = GetString(n, ",", 2, 2)  // value = "0b1111011"
```

* Separator is only effective to array input

? **byte[]** n = {12, 34, 56}

```
value = GetString(n, "-")       // value = "12-34-56"  
value = GetString(n, Ctrl("\r\n"), 10) // value = "12\u00D0A34\u00D0A56"  
value = GetString(n, newline, 16) // value = "0x0C\u00D0A0x22\u00D0A0x38"  
value = GetString(n, NewLine, 2) // value = "0b00001100\u00D0A0b00100010\u00D0A0b00111000"  
value = GetString(n, "-", 16, 3) // value = "C-22-38"  
value = GetString(n, "-", 2, 2)  // value = "0b1100-0b100010-0b111000"
```

* **\u00D0A** is Newline control character, not string value.

Syntax 7

```
string GetString(  
    ?,  
    string,  
    string,  
    int,  
    int  
)
```

Parameters

- ?** The input data. Data type can be int, float, double, bool, string or array.
- string** The index of the output string for array input. (Only effective to ? as array type data)
- * Support numeric format strings
- string** Separator for output string (Only effective to array input)
- int** The output string's notation is decimal, hexadecimal or binary (Can be only applied to hexadecimal or binary number)
- | | |
|----|-------------|
| 10 | decimal |
| 16 | hexadecimal |
| 2 | binary |
- String's notation
- | | |
|-------|-------------|
| 123 | decimal |
| 0x7F | hexadecimal |
| 0b101 | binary |
- int** The output string format (Can be only applied to hexadecimal or binary number)
- | | |
|---|---|
| 0 | Fill up digits. Add prefix 0x or 0b, e.g. 0x0C or 0b00001100 |
| 1 | Fill up digits. No prefix 0x or 0b, e.g. 0C or 00001100 |
| 2 | Don't fill up digits. Add prefix 0x or 0b, e.g. 0xC or 0b1100 |
| 3 | Don't fill up digits. No prefix 0x or 0b, e.g. C or 1100 |

Return

- string** The string value formed by input data. For input data not convertible, an empty string will be returned. For array type input, every element is converted to string with index prefix and separator.

Syntax 8

```
string GetString(  
    ?,  
    string,  
    string,  
    int  
)
```

Note

Similar to Syntax7 with filling up digits and adding prefix.

GetString(?, str, str, 16) => GetString(?, str, str, 16, 0)

Syntax 9

```
string GetString(  
    ?,  
    string,  
    string  
)
```

Note

Similar to Syntax7 with decimal output, with filling up digits and adding prefix.

GetString(?, str, str) => GetString(?, str, str, 10, 0)

? **byte** n = 123

```
value = GetString(n)           // value = "123"  
value = GetString(n, "[0]=", ",", 10) // value = "123"  
value = GetString(n, "[0]=", "-", 16) // value = "0x7B"  
value = GetString(n, "[0]=", "#", 2)  // value = "0b01111011"
```

* Index and separator are only effective to array input.

? **byte[]** n = {12, 34, 56}

```
value = GetString(n, "[0]=", "-")           // value = "[0]=12-[1]=34-[2]=56"  
value = GetString(n, "[0]=", Ctrl("\r\n"), 10) // value = "[0]=12\u00D0A[1]=34\u00D0A[2]=56"  
value = GetString(n, "[0]=", newline, 16) // value = "[0]=0x0C\u00D0A[1]=0x22\u00D0A[2]=0x38"  
value = GetString(n, "[0]=", "-", 16, 3) // value = "[0]=C-[1]=22-[2]=38"  
value = GetString(n, "[0]=", "-", 2, 2) // value = "[0]=0b1100-[1]=0b100010-[2]=0b111000"
```

* "[0]=" Support numeric format strings

* **\u00D0A** is Newline control character, not string value.

2.32 *GetToken()*

Retrieves a substring from input string, or the sub-array from the input byte[] array

Syntax 1

```
string GetToken (  
    string,  
    string,  
    string,  
    int,  
    int  
)
```

Parameters

`string` Input string
`string` Prefix. The leading element of the substring
`string` Suffix. The trailing element of the substring
`int` The number of occurrence
`int` Remove the prefix and suffix or not
 0 Reserve prefix and suffix (Default)
 1 Remove prefix and suffix

Return

`string` String formed by part of the input string
If the `prefix and suffix are empty`, returns the input string
If `the number of occurrence<=0`, returns empty string

Syntax 2

```
string GetToken (  
    string,  
    string,  
    string,  
    int  
)
```

Note

Similar to Syntax1 with reserving prefix and suffix.

GetToken(str,str,str,1) => GetToken(str,str,str,1,0)

Syntax 3

```
string GetToken (  
    string,  
    string,  
    string  
)
```

Note

Similar to Syntax1 with returning the first occurrence, and reserving prefix and suffix.

GetToken(str,str,str) => GetToken(str,str,str,1,0)

```
string n = "$abcd$1234$ABCD$"
```

```
value = GetToken(n, "", "", 0)      // value = "$abcd$1234$ABCD$"  
value = GetToken(n, "$", "$")      // value = "$abcd$"  
value = GetToken(n, "$", "$", 0)    // value = ""  
value = GetToken(n, "$", "$", 1)    // value = "$abcd$"  
value = GetToken(n, "$", "$", 2)    // value = "$ABCD$"  
value = GetToken(n, "$", "$", 3)    // value = ""  
value = GetToken(n, "$", "$", 1, 1) // value = "abcd"  
value = GetToken(n, "$", "$", 2, 1) // value = "ABCD"  
value = GetToken(n, "$", "", 1)     // value = "$abcd"  
value = GetToken(n, "$", "", 2)     // value = "$1234"  
value = GetToken(n, "$", "", 3)     // value = "$ABCD"  
value = GetToken(n, "$", "", 4)     // value = "$"  
value = GetToken(n, "", "$", 1)     // value = "$"  
value = GetToken(n, "", "$", 2)     // value = "abcd$"  
value = GetToken(n, "", "$", 3)     // value = "1234$"  
value = GetToken(n, "", "$", 4)     // value = "ABCD$"
```

```
string n = "$abcd$1234$ABCD$" + Ctrl("\r\n") + "56\r\n78$"
```

```
value = GetToken(n, "$", Ctrl("\r\n"), 1) // value = "$abcd$1234$ABCD$\u000A"  
value = GetToken(n, "$", newline, 2)     // value = ""  
value = GetToken(n, "$", NewLine, 1, 1)  // value = "abcd$1234$ABCD$" // Remove prefix and suffix  
value = GetToken(n, Ctrl("\r\n"), "$", 1) // value = "\u000A56\r\n78$"  
value = GetToken(n, newline, "$", 2)     // value = ""  
value = GetToken(n, NewLine, "$", 1, 1)  // value = "56\r\n78"
```

* **\u000A** is Newline control character, not string value.

Syntax 4

```
string GetToken (  
    string,  
    byte[],  
    byte[],  
    int,  
    int  
)
```

Parameters

`string` Input string
`byte[]` Prefix. The leading element of the substring, `byte[]` type
`byte[]` Suffix. The trailing element of the substring, `byte[]` type
`int` The number of occurrence
`int` Remove prefix and suffix or not
0 Reserve prefix and suffix (Default)
1 Remove prefix and suffix

Return

`string` String formed by part of the input string
If the `prefix and suffix are empty`, returns the input string
If `the number of occurrence<=0`, returns empty string

Syntax 5

```
string GetToken (  
    string,  
    byte[],  
    byte[],  
    int  
)
```

Note

Similar to Syntax4 with reserving prefix and suffix

GetToken(str,byte[],byte[],1) => GetToken(str,byte[],byte[],1,0)

Syntax 6

```
string GetToken (  
    string,  
    byte[],  
    byte[]  
)
```

Note

Similar to Syntax 4 with the first occurrence and reserving prefix and suffix

GetToken(str,byte[],byte[]) => GetToken(str,byte[],byte[],1,0)

```
string n = "$abcd$1234$ABCD$"
```

```
byte[] bb0 = {}, bb1 = {0x24}    // 0x24 is $
```

```
value = GetToken(n, bb0, bb0, 0)    // value = "$abcd$1234$ABCD$"
```

```
value = GetToken(n, bb1, bb1)    // value = "$abcd$"
```

```
value = GetToken(n, bb1, bb1, 0)    // value = ""
```

```
value = GetToken(n, bb1, bb1, 1)    // value = "$abcd$"
```

```
value = GetToken(n, bb1, bb1, 2)    // value = "$ABCD$"
```

```
value = GetToken(n, bb1, bb1, 3)    // value = ""
```

```
value = GetToken(n, bb1, bb1, 1, 1) // value = "abcd"
```

```
value = GetToken(n, bb1, bb1, 2, 1) // value = "ABCD"
```

```
value = GetToken(n, bb1, bb0, 1)    // value = "$abcd"
```

```
value = GetToken(n, bb1, bb0, 2)    // value = "$1234"
```

```
value = GetToken(n, bb1, bb0, 3)    // value = "$ABCD"
```

```
value = GetToken(n, bb1, bb0, 4)    // value = "$"
```

```
value = GetToken(n, bb0, bb1, 1)    // value = "$"
```

```
value = GetToken(n, bb0, bb1, 2)    // value = "abcd$"
```

```
value = GetToken(n, bb0, bb1, 3)    // value = "1234$"
```

```
value = GetToken(n, bb0, bb1, 4)    // value = "ABCD$"
```

```
string n = "$abcd$1234$ABCD$" + Ctrl("\r\n") + "56\r\n78$"
```

```
byte[] bb0 = {0x0D,0x0A}, bb1 = {0x24}    // 0x24 is $ // 0x0D,0x0A is \u000A
```

```
value = GetToken(n, bb1, bb0, 1)    // value = "$abcd$1234$ABCD$\u000A"
```

```
value = GetToken(n, bb1, bb0, 2)    // value = ""
```

```
value = GetToken(n, bb1, bb0, 1, 1) // value = "abcd$1234$ABCD$"    // 去除前置與後置
```

```
value = GetToken(n, bb0, bb1, 1)    // value = "\u000A56\r\n78$"
```

```
value = GetToken(n, bb0, bb1, 2)    // value = ""
```

```
value = GetToken(n, bb0, bb1, 1, 1) // value = "56\r\n78"
```

* **\u000A** is Newline control character, not string value.

Syntax 7

```
byte[] GetToken (  
    byte[],  
    string,  
    string,  
    int,  
    int  
)
```

Parameters

`byte[]` The input byte[]
`string` Prefix. The leading element of the output byte[], byte[] type
`string` Suffix. The trailing element of the output byte[], byte[] type
`int` The number of occurrence
`int` Remove prefix and suffix or not
0 Reserve prefix and suffix (Default)
1 Remove prefix and suffix

Return

`byte[]` The byte[] formed from part of the input byte[]
If the [prefix and suffix are empty](#), returns the input array
If [the number of occurrence<=0](#), returns empty array

Syntax 8

```
byte[] GetToken (  
    byte[],  
    string,  
    string,  
    int  
)
```

Note

Similar to Syntax7 with reserving prefix and suffix

GetToken(byte[],str,str,1) => **GetToken**(byte[],str,str,1,0)

Syntax 9

```
byte[] GetToken (  
    byte[],  
    string,  
    string  
)
```

Note

Similar to Syntax7 with returning the first occurrence, and reserving prefix and suffix.

GetToken(byte[],str,str) => **GetToken**(byte[],str,str,1,0)

```
string s = "$abcd$1234$ABCD$"
```

```
byte[] n = GetBytes(s)
```

```
value = GetToken(n, "", "", 0)    // value = {0x24,0x61,0x62,0x63,0x64,0x24,0x31,0x32,0x33,0x34,0x24,0x41,0x42,0x43,0x44,0x24}  
value = GetToken(n, "$", "$")    // value = {0x24,0x61,0x62,0x63,0x64,0x24}  
value = GetToken(n, "$", "$", 0)  // value = {}  
value = GetToken(n, "$", "$", 1)  // value = {0x24,0x61,0x62,0x63,0x64,0x24}  
value = GetToken(n, "$", "$", 2)  // value = {0x24,0x41,0x42,0x43,0x44,0x24}  
value = GetToken(n, "$", "$", 1, 1) // value = {0x61,0x62,0x63,0x64}  
value = GetToken(n, "$", "$", 2, 1) // value = {0x41,0x42,0x43,0x44}  
value = GetToken(n, "$", "", 1)   // value = {0x24,0x61,0x62,0x63,0x64}  
value = GetToken(n, "$", "", 2)   // value = {0x24,0x31,0x32,0x33,0x34}  
value = GetToken(n, "$", "", 3)   // value = {0x24,0x41,0x42,0x43,0x44}  
value = GetToken(n, "$", "", 4)   // value = {0x24}  
value = GetToken(n, "", "$", 1)   // value = {0x24}  
value = GetToken(n, "", "$", 2)   // value = {0x61,0x62,0x63,0x64,0x24}  
value = GetToken(n, "", "$", 3)   // value = {0x31,0x32,0x33,0x34,0x24}  
value = GetToken(n, "", "$", 4)   // value = {0x41,0x42,0x43,0x44,0x24}
```

```
string s = "$abcd$1234$ABCD$" + Ctrl("\r\n") + "56\r\n78$"
```

```
byte[] n = GetBytes(s)
```

```
value = GetToken(n, "$", Ctrl("\r\n"), 1)  
    // value = {0x24,0x61,0x62,0x63,0x64,0x24,0x31,0x32,0x33,0x34,0x24,0x41,0x42,0x43,0x44,0x24,0x0D,0x0A}  
value = GetToken(n, "$", Ctrl("\r\n"), 1, 1)  
    // value = {0x61,0x62,0x63,0x64,0x24,0x31,0x32,0x33,0x34,0x24,0x41,0x42,0x43,0x44,0x24}    // Removing prefix and  
    suffix  
value = GetToken(n, Ctrl("\r\n"), "$", 1)  
    // value = {0x0D,0x0A,0x35,0x36,0x5C,0x72,0x5C,0x6E,0x37,0x38,0x24}  
value = GetToken(n, Ctrl("\r\n"), "$", 1, 1)
```

```
// value = {0x35,0x36,0x5C,0x72,0x5C,0x6E,0x37,0x38}
```

Syntax 10

```
byte[] GetToken (  
    byte[],  
    byte[],  
    byte[],  
    int,  
    int  
)
```

Parameters

byte[] The input byte[] array
byte[] Prefix. The leading element of the output byte[]
byte[] Suffix. The trailing element of the output byte[]
int The number of occurrence
int Remove prefix and suffix or not
0 Reserve prefix and suffix (Default)
1 Remove prefix and suffix

Return

byte[] The byte[] formed from part of the input byte[]
If the [prefix and suffix are empty](#), returns the input array
If [the number of occurrence<=0](#), returns empty array

Syntax 11

```
byte[] GetToken (  
    byte[],  
    byte[],  
    byte[],  
    int  
)
```

Note

Similar to Syntax10 with reserving the prefix and suffix

GetToken(byte[],byte[],byte[],1) => **GetToken**(byte[],byte[],byte[],1,0)

Syntax 12

```
byte[] GetToken (  
    byte[],  
    byte[],  
    byte[]  
)
```

Note

Similar to Syntax10 with returning the first occurrence, and reserving prefix and suffix.

GetToken(byte[],byte[],byte[]) => **GetToken**(byte[],byte[],byte[],1,0)

```
string s = "$abcd$1234$ABCD$"
```

```
byte[] n = GetBytes(s)
```

```
byte[] bb0 = {}, bb1 = {0x24}    // 0x24 is $
```

```
value = GetToken(n, bb0, bb0, 0) // value = {0x24,0x61,0x62,0x63,0x64,0x24,0x31,0x32,0x33,0x34,0x24,0x41,0x42,0x43,0x44,0x24}
```

```
value = GetToken(n, bb1, bb1)    // value = {0x24,0x61,0x62,0x63,0x64,0x24}
```

```
value = GetToken(n, bb1, bb1, 0) // value = {}
```

```
value = GetToken(n, bb1, bb1, 1) // value = {0x24,0x61,0x62,0x63,0x64,0x24}
```

```
value = GetToken(n, bb1, bb1, 2) // value = {0x24,0x41,0x42,0x43,0x44,0x24}
```

```
value = GetToken(n, bb1, bb1, 1, 1) // value = {0x61,0x62,0x63,0x64}
```

```
value = GetToken(n, bb1, bb1, 2, 1) // value = {0x41,0x42,0x43,0x44}
```

```
value = GetToken(n, bb1, bb0, 1)    // value = {0x24,0x61,0x62,0x63,0x64}
```

```
value = GetToken(n, bb1, bb0, 2)    // value = {0x24,0x31,0x32,0x33,0x34}
```

```
value = GetToken(n, bb1, bb0, 3)    // value = {0x24,0x41,0x42,0x43,0x44}
```

```
value = GetToken(n, bb0, bb1, 1)    // value = {0x24}
```

```
value = GetToken(n, bb0, bb1, 2)    // value = {0x61,0x62,0x63,0x64,0x24}
```

```
value = GetToken(n, bb0, bb1, 3)    // value = {0x31,0x32,0x33,0x34,0x24}
```

```
string s = "$abcd$1234$ABCD$" + Ctrl("\r\n") + "56\r\n78$"
```

```
byte[] n = GetBytes(s)
```

```
byte[] bb0 = {0x0D,0x0A}, bb1 = {0x24}
```

```
value = GetToken(n, bb1, bb0, 1)
```

```
    // value = {0x24,0x61,0x62,0x63,0x64,0x24,0x31,0x32,0x33,0x34,0x24,0x41,0x42,0x43,0x44,0x24,0x0D,0x0A}
```

```
value = GetToken(n, bb1, bb0, 1, 1)
```

```
    // value = {0x61,0x62,0x63,0x64,0x24,0x31,0x32,0x33,0x34,0x24,0x41,0x42,0x43,0x44,0x24}    // Remove prefix and
```

```
suffix
```

```
value = GetToken(n, bb0, bb1, 1)
```

```
    // value = {0x0D,0x0A,0x35,0x36,0x5C,0x72,0x5C,0x6E,0x37,0x38,0x24}
```

```
value = GetToken(n, bb0, bb1, 1, 1)
```

```
// value = {0x35,0x36,0x5C,0x72,0x5C,0x6E,0x37,0x38}
```

```
value = GetAllTokens(n, "", "$", 1)    // value = {"", "abcd", "1234", "ABCD"}
```

2.34 GetNow()

Capture the current system time

Syntax 1

```
string GetNow(  
    string  
)
```

Parameters

string The date and time format strings defining the text representation of a date and time value. The definition of each specifier is listed below. The strings not included will remain the same.

d	One-digit day of the month for days below 10, from 1 to 31
dd	Two-digit day of the month, from 01 to 31
ddd	Three-letter abbreviation for day of the week, e.g. Mon
dddd	Day of the week spelled out in full, e.g. Monday
f	Second to 0.1 second
ff	Second to 0.01 Second
fff	Second to 0.001 Second
ffff	Second to 0.0001 Second
h	One-digit hour for hours below 10 in 12-hour format, from 1 to 12
hh	Two-digit hour in 12-hour format, from 01 to 12
H	One-digit hour for hours below 10 in 12-hour format, from 0 to 23
HH	Two-digit hour in 24-hour format, from 00 to 23
m	One-digit minute for minutes below 10, from 0 to 59
mm	Two-digit minute, from 00 to 59
M	One-digit month for months below 10, from 1 to 12
MM	Two-digit month, from 01 to 12
MMM	Three-letter abbreviation for month, Jun
MMMM	Month spelled out in full, June
s	One-digit second for seconds below 10, from 0 to 59
ss	Two-digit second, from 00 to 59
t	The first digit of AM/PM
tt	AM/PM
y	One-digit year for years below 10, from 0 to 99
yy	Two-digit year, from 00 to 99
yyyy	four-digit year
/	Separator for date. / or – or . (Based on different languages)

Return

string Current date and time. If there is an error in format setting, the default format will be applied.

Note

```
value = GetNow("MM/dd/yyyy HH:mm:ss")           // value = 08/15/2017 13:40:30
value = GetNow("yyyy/MM/dd HH:mm:ss.ffff")       // value = 2017/08/15 13:40:30.123
value = GetNow("yyyy-MM-dd hh:mm:ss tt")         // value = 2017-08-15 01:40:30 PM
```

Syntax 2

```
string GetNow(
)
```

Parameters

`void` No format defined. Default format "MM/dd/yyyy HH:mm:ss" will be applied

Return

`string` Current date and time.

Note

```
value = GetNow()           // value = 08/15/2017 13:40:30
```

2.35 GetNowStamp()

The total run time or difference in total run time

Syntax 1

```
int GetNowStamp (
)
```

Parameters

`void` No parameter

Return

`int` The total run time of the current project in ms. The upper limit is 2147483647 ms
`< 0` Over flow, invalid total run time

Note

```
value = GetNowStamp()      // value = 2147483647
... others ...
value = GetNowStamp()      // value = -1      // Over flow
```

Syntax 2

```
double GetNowStamp (
    bool
)
```

Parameters

`bool` Use double format to record project's total run time or not?
`true` Use double type, the upper limit is 9223372036854775807 ms
`false` Use int32 type, the upper limit is 2147483647 ms

Return

`double` The total run time of the current project
`< 0` Over flow. Invalid total run time.

Note

```
value = GetNowStamp(false)      // value = 2147483647
... others ...
value = GetNowStamp(false)      // value = -1      // Over flow
value = GetNowStamp(true)      // value = 3147483647
```

Syntax 3

```
int GetNowStamp (  
    int  
)
```

Parameters

`int` Previous recorded run time in ms

Return

`int` The difference between the current run time and the input run time in ms.
Run time difference = current run time – input run time
`< 0` Invalid run time difference, caused by input run time larger than current run time, or over flow.

Note

```
value = GetNowStamp()           // value = 2147483546  
... others ... (After 100ms)  
diff = GetNowStamp(value)       // diff = 100  
... others ... (After 200ms)  
diff = GetNowStamp(value)       // diff = -1      // Value is over 2147483647
```

Syntax 4

```
double GetNowStamp (  
    double  
)
```

Parameters

`double` Previous recorded run time in ms

Return

`double` The difference between the current run time and the input run time in ms.
Run time difference = current run time – input run time
`< 0` Invalid run time difference, caused by input run time larger than current run time, or over flow.

Note

```
value = GetNowStamp()           // value = 2147483546  
... others ... (After 100ms)  
diff = GetNowStamp(value)       // diff = 100  
... others ... (After 200ms)  
diff = GetNowStamp(value)       // diff = 200
```

Syntax 5

```
bool GetNowStamp (  
    int,  
    int  
)
```

Parameters

`int` Previous recorded run time in ms
`int` The expected run time difference

Return

`bool` The time difference between current run time and input run time is larger than the expected run time difference or not.

`true` (Current run time – input run time) >= expected run time
`Or` Time difference smaller than zero or over flow
`false` (Current run time – input run time) < expected run time

Note

```
value = GetNowStamp()           // value = 41730494  
... others ... (After 60ms)  
flag = GetNowStamp(value, 100)  // diff = 60      // flag = false  
... others ... (After 60ms)  
flag = GetNowStamp(value, 100)  // diff = 120     // flag = true
```

Syntax 6

```
bool GetNowStamp (  
    double,  
    double  
)
```

Parameters

`double` Previous recorded run time in ms
`double` The expected run time difference

Return

`bool` The time difference between current run time and input run time is larger than the expected run time difference or not.

`true` (Current run time – input run time) >= expected run time
`Or` Time difference smaller than zero or over flow
`false` (Current run time – input run time) < expected run time

Note

```
value = GetNowStamp()           // value = 41730494  
... others ... (After 60ms)
```

```
flag = GetNowStamp(value, 100)    // diff = 60    // flag = false
... others ... (After 60ms)
flag = GetNowStamp(value, 100)    // diff = 120   // flag = true
```

2.36 Length()

Acquire the number of byte of input data, length of string or length of array (number of elements in array)

Syntax 1

```
int Length (  
    ?  
)
```

Parameters

? The input data. The data type could be integer, floating number, 輸入的原始值, booling, string or array

Return

int Length of data
For input as integer, floating number and booling, returns the number of byte.
For input as string, returns the length of string.
For input as array, returns the number of element in array

Note

```
? byte n = 100  
value = Length(n)      // value = 1  
value = Length(100)    // value = 1  
  
? int n = 400  
value = Length(n)      // value = 4  
value = Length(400)    // value = 4  
  
? float n = 1.234  
value = Length(n)      // value = 4  
value = Length(1.234)    // value = 4  
  
? double n = 1.234  
value = Length(n)      // value = 8  
value = Length(1.234)    // value = 4      // float // Numbers would be stored as the smaller data type first.  
  
? bool n = true  
value = Length(n)      // value = 1  
value = Length(false)    // value = 1
```

? `string n = "A"BC"`
`value = Length(n)` `// value = 4` `// The string is A"BC. Two double quotation marks represent " in string`

`value = Length("")` `// value = 0`
`value = Length("123")` `// value = 3`
`value = Length(empty)` `// value = 0`

? `byte[] n = {100, 200, 30}`
`value = Length(n)` `// value = 3`

? `int[] n = {}`
`value = Length(n)` `// value = 0`
`n = {400, 500, 600}`
`value = Length(n)` `// value = 3`

? `float[] n = {1.234}`
`value = Length(n)` `// value = 1`

? `double[] n = {1.234, 200, -100, +300}`
`value = Length(n)` `// value = 4`

? `bool[] n = {true, false, true, true, true, true, false}`
`value = Length(n)` `// value = 7`

? `string[] n = {"A"BC", "123", "456", "ABC"}`
`value = Length(n)` `// value = 4`

2.37 Ctrl()

Change the integer or string to control characters

Syntax 1

```
string Ctrl (  
    int  
)
```

Parameters

int The input integer, which follows the Big Endian format. 4 characters could be transformed at most. 0x00 will not be transformed.

Return

string The string formed by input integer (contains the control character)

Note

```
b = 0x0D0A  
value = Ctrl(b)           // value = \r\n  
value = Ctrl(0x0D0A)      // value = \r\n  
value = Ctrl(0x0D000A09)  // value = \r\n\t      // 0x00 will not be transformed  
value = Ctrl(0x0D300A09) // value = \r0\n\t      // 0x30 is transformed to 0  
value = Ctrl(0x00)        // value = ""      // empty string does not equal to NULL. For NULL, the code is  
                           Ctrl("\0")
```

Syntax 2

```
string Ctrl (  
    string  
)
```

Parameters

string Input string. The following rules will be applied. For string not on the list, it will remain the same.

<code>\0</code>	0x00 null
<code>\a</code>	0x07 bell
<code>\b</code>	0x08 backspace
<code>\t</code>	0x09 horizontal tab
<code>\r</code>	0x0D carriage return
<code>\v</code>	0x0B vertical tab
<code>\f</code>	0x0C form feed
<code>\n</code>	0x0A line feed

Return

string The string formed by input integer (contains the control character)

Note

```
b = "\r\n"
value = Ctrl(b)           // value = \r\n
value = Ctrl("\r\n")      // value = \r\n
value = Ctrl("\r\n\t")    // value = \r\n\t
value = Ctrl("\r0\n\t")   // value = \r0\n\t
value = Ctrl("\0")        // value = \0    // NULL
```

Syntax 3

```
string Ctrl (
    byte[]
)
```

Parameters

byte[] The input byte array, the transfer will start from index [0] to the end of the array. (0x00 will be transferred also)

Return

string The string formed by input integer (contains the control character)

Note

```
byte[] bb1 = {0xFF,0x55,0x31,0x32,0x33,0x00,0x35,0x36,0x0D,0x0A}
value = Ctrl(bb1)           // value = U123 56\r\n

byte[] bb2 = {}
value = Ctrl(bb2)           // value = ""
```

2.38 XOR8()

Utilize XOR 8 bits algorithm to computes the checksum

Syntax 1

```
byte XOR8 (  
    byte[],  
    int,  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The starting index

`0..(array size-1)` Valid

`<0` Invalid. Returns the initial value 0

`>=array size` Invalid. Returns the initial value 0

`int` The number of elements to be computed.

If the number of elements `<0`, the calculation ends at the last element of the array

If the sum of strating index and number of element exceeds the array size, the calculation ends at the last element of the array.

Return

`byte` Checksum.

Note

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = XOR8(bb1,0,Length(bb1))    // value = 0x6F
```

```
value = XOR8(bb1,0,-1)              // value = 0x6F
```

```
value = XOR8(bb1,1,-1)              // value = 0x7F
```

```
value = XOR8(bb1,-1,-1)             // value = 0
```

Syntax 2

```
byte XOR8 (  
    byte[],  
    int  
)
```

Note

Similar to Syntax1 with computing to the last element of the array

```
XOR8(byte[], int) => XOR8(byte[], int, Length(byte[]))
```

Syntax 3

```
byte XOR8 (  
    byte[]  
)
```

Note

Similar to Syntax1 with computing all the elements of the array

XOR8(byte[]) => **XOR8**(byte[], 0, Length(byte[]))

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = XOR8(bb1,0,Length(bb1))           // value = 0x6F
```

```
value = XOR8(bb1,0)                       // value = 0x6F
```

```
value = XOR8(bb1)                         // value = 0x6F
```

```
bb1 = Byte_Concat(bb1, XOR(bb1))          // bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF, 0x6F}
```

2.39 SUM8()

Utilize SUM 8 bits algorithm to computes the checksum

Syntax 1

```
byte SUM8 (  
    byte[],  
    int,  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The starting index

`0..array size-1` Valid

`<0` Invalid. Returns the initial value 0

`>=array size` Invalid. Returns the initial value 0

`int` The number of elements to be computed.

If the number of elements `<0`, the calculation ends at the last element of the array

If the sum of strating index and number of element exceeds the array size, the calculation ends at the last element of the array.

Return

`byte` Checksum.

Note

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = SUM8(bb1,0,Length(bb1))    // value = 0x6D
```

```
value = SUM8(bb1,0,-1)              // value = 0x6D
```

```
value = SUM8(bb1,1,-1)              // value = 0x5D
```

```
value = SUM8(bb1,-1,-1)             // value = 0
```

Syntax 2

```
byte SUM8 (  
    byte[],  
    int  
)
```

Note

Similar to Syntax1 with computing to the last element of the array

```
SUM8(byte[], int) => SUM8(byte[], int, Length(byte[]))
```

Syntax 3

```
byte SUM8 (  
    byte[]  
)
```

Note

Similar to Syntax1 with computing all the elements of the array

SUM8(byte[]) => **SUM8**(byte[], 0, Length(byte[]))

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = SUM8(bb1,0,Length(bb1))           // value = 0x6D
```

```
value = SUM8(bb1,0)                       // value = 0x6D
```

```
value = SUM8(bb1)                         // value = 0x6D
```

```
bb1 = Byte_Concat(bb1, SUM8(bb1))        // bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF, 0x6D}
```

2.40 SUM16()

Utilize SUM 16 bits algorithm to computes the checksum

Syntax 1

```
byte[] SUM16 (  
    byte[],  
    int,  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The starting index

`0..array size-1` Valid

`<0` Invalid. Returns the initial value 0

`>=array size` Invalid. Returns the initial value 0

`int` The number of elements to be computed.

If the number of elements `<0`, the calculation ends at the last element of the array

If the sum of strating index and number of element exceeds the array size, the calculation ends at the last element of the array.

Return

`byte[]` Checksum. The length is 16bits 2 bytes (The Checksum follows Big Endian)

Note

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = SUM16(bb1,0,Length(bb1)) // value = {0x04, 0x6D}
```

```
value = SUM16(bb1,0,-1)           // value = {0x04, 0x6D}
```

```
value = SUM16(bb1,1,-1)           // value = {0x04, 0x5D}
```

```
value = SUM16(bb1,-1,-1)          // value = {0x00, 0x00}
```

Syntax 2

```
byte[] SUM16 (  
    byte[],  
    int  
)
```

Note

Similar to Syntax1 with computing to the last element of the array

```
SUM16(byte[], int) => SUM16(byte[], int, Length(byte[]))
```

Syntax 3

```
byte[] SUM16(  
    byte[]  
)
```

Note

Similar to Syntax1 with computing all the elements of the array

SUM16(byte[]) => **SUM16**(byte[], 0, Length(byte[]))

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = SUM16(bb1,0,Length(bb1))    // value = {0x04, 0x6D}
```

```
value = SUM16(bb1,0)                // value = {0x04, 0x6D}
```

```
value = SUM16(bb1)                  // value = {0x04, 0x6D}
```

```
bb1 = Byte_Concat(bb1, SUM16(bb1)) // bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF, 0x04, 0x6D}
```

2.41 SUM32()

Utilize SUM 32 bits algorithm to computes the checksum

Syntax 1

```
byte[] SUM32 (  
    byte[],  
    int,  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The starting index

`0..array size-1` Valid

`<0` Invalid. Returns the initial value 0

`>=array size` Invalid. Returns the initial value 0

`int` The number of elements to be computed.

If the number of elements `<0`, the calculation ends at the last element of the array

If the sum of strating index and number of element exceeds the array size, the calculation ends at the last element of the array.

Return

`byte[]` Checksum. The length is 32bits 4 bytes (The Checksum follows Big Endian)

Note

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = SUM32(bb1,0,Length(bb1)) // value = {0x00, 0x00, 0x04, 0x6D}
```

```
value = SUM32(bb1,0,-1)           // value = {0x00, 0x00, 0x04, 0x6D}
```

```
value = SUM32(bb1,1,-1)           // value = {0x00, 0x00, 0x04, 0x5D}
```

```
value = SUM32(bb1,-1,-1)          // value = {0x00, 0x00, 0x00, 0x00}
```

Syntax 2

```
byte[] SUM32 (  
    byte[],  
    int  
)
```

Note

Similar to Syntax1 with computing to the last element of the array

```
SUM32(byte[], int) => SUM32(byte[], int, Length(byte[]))
```

Syntax 3

```
byte[] SUM32 (  
    byte[]  
)
```

Note

Similar to Syntax1 with computing all the elements of the array

SUM32(byte[]) => **SUM32**(byte[], 0, Length(byte[]))

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = SUM32(bb1,0,Length(bb1))           // value = {0x00, 0x00, 0x04, 0x6D}
```

```
value = SUM32(bb1,0)                         // value = {0x00, 0x00, 0x04, 0x6D}
```

```
value = SUM32(bb1)                           // value = {0x00, 0x00, 0x04, 0x6D}
```

```
bb1 = Byte_Concat(bb1, SUM32(bb1))          // bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF, 0x00, 0x00, 0x04, 0x6D}
```

2.42 CRC16()

Utilize CRC 16 bits algorithm to computes the checksum

Syntax 1

```
byte[] CRC16(  
    int,  
    byte[],  
    int,  
    int  
)
```

Parameters

<code>int</code>	CRC16 algorithm (Reference https://www.lammertbies.nl/comm/info/crc-calculation.html)
0	CRC16 // initial value 0x0000 // Polynomial 0xA001
1	CRC16 (Modbus) // initial value 0xFFFF // Polynomial 0xA001
2	CRC16 (Sick) // initial value 0x0000 // Polynomial 0x8005
3	CRC16-CCITT (0x1D0F) // initial value 0x1D0F // Polynomial 0x1021
4	CRC16-CCITT (0xFFFF) // initial value 0xFFFF // Polynomial 0x1021
5	CRC16-CCITT (XModem) // initial value 0x0000 // Polynomial 0x1021
6	CRC16-CCITT (Kermit) // initial value 0x0000 // Polynomial 0x8408
7	CRC16 Schunk Gripper // initial value 0xFFFF // Polynomial 0x1021

`byte[]` The input byte array

`int` The starting index

`0..array size-1` Valid

`<0` Invalid. Returns the initial value

`>=array size` Invalid. Returns the initial value

`int` The number of elements to be computed.

If the number of elements `<0`, the calculation ends at the last element of the array

If the sum of starting index and number of element exceeds the array size, the calculation ends at the last element of the array.

Return

`byte[]` Checksum. The length is 16bits 2 bytes (The checksum follows Big Endian)

Note

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
value = CRC16(0, bb1, 0, Length(bb1))    // value = {0x2D, 0xD4}
value = CRC16(0, bb1, 0, -1)              // value = {0x2D, 0xD4}
value = CRC16(0, bb1, 1, -1)              // value = {0xEC, 0xC5}
value = CRC16(0, bb1, -1, -1)             // value = {0x00, 0x00}
value = CRC16(3, bb1, 0, Length(bb1))    // value = {0x42, 0x12}
value = CRC16(4, bb1, 0, Length(bb1))    // value = {0xAB, 0xAE}
```

Syntax 2

```
byte[] CRC16 (
    int,
    byte[],
    int
)
```

Note

Similar to Syntax1 with computing to the last element of the array

CRC16(int, byte[], int) => CRC16(int, byte[], int, Length(byte[]))

Syntax 3

```
byte[] CRC16 (
    int,
    byte[]
)
```

Note

Similar to Syntax1 with computing all the elements of the array

CRC16(int, byte[]) => CRC16(int, byte[], 0, Length(byte[]))

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
value = CRC16(0, bb1, 0, Length(bb1))    // value = {0x2D, 0xD4}
value = CRC16(0, bb1, 0)                  // value = {0x2D, 0xD4}
value = CRC16(0, bb1)                     // value = {0x2D, 0xD4}
bb1 = Byte_Concat(bb1, CRC16(0, bb1))    // bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF, 0x2D, 0xD4}
```

Syntax 4

```
byte[] CRC16(  
    byte[],  
    int,  
    int  
)
```

Note

Similar to Syntax1 with CRC16 algorithm as 0 CRC16

CRC16(byte[], int, int) => **CRC16**(0, byte[], int, int)

Syntax 5

```
byte[] CRC16(  
    byte[],  
    int  
)
```

Note

Similar to Syntax1 with CRC16 algorithm as 0 CRC16 and computing to the last element of the array

CRC16(byte[], int) => **CRC16**(0, byte[], int, Length(byte[]))

Syntax 6

```
byte[] CRC16(  
    byte[]  
)
```

Note

Similar to Syntax1 with CRC16 algorithm as 0 CRC16 and computing all the elements of the array

CRC16(byte[]) => **CRC16**(0, byte[], 0, Length(byte[]))

2.43 CRC32()

Utilize CRC 32 bits algorithm to computes the checksum

Syntax 1

```
byte[] CRC32 (  
    byte[],  
    int,  
    int  
)
```

Parameters

`byte[]` The input byte array

`int` The starting index

`0..array size-1` Valid

`<0` Invalid. Returns the initial value 0

`>=array size` Invalid. Returns the initial value 0

`int` The number of elements to be computed.

If the number of elements `<0`, the calculation ends at the last element of the array

If the sum of strating index and number of element exceeds the array size, the calculation ends at the last element of the array.

Return

`byte[]` Checksum. The checksum length is 32bits 4 bytes (The checksum follows Big Endian)

Note

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = CRC32(bb1,0,Length(bb1)) // value = {0x43, 0xD5, 0xB9, 0xF8}
```

```
value = CRC32(bb1,0,-1) // value = {0x43, 0xD5, 0xB9, 0xF8}
```

```
value = CRC32(bb1,1,-1) // value = {0x08, 0xA5, 0x5B, 0xEB}
```

```
value = CRC32(bb1,-1,-1) // value = {0x00, 0x00, 0x00, 0x00}
```

Syntax 2

```
byte[] CRC32 (  
    byte[],  
    int  
)
```

Note

Similar to Syntax1 with computing to the last element of the array

CRC32(byte[], int) => CRC32(byte[], int, Length(byte[]))

Syntax 3

```
byte[] CRC32 (  
    byte[]  
)
```

Note

Similar to Syntax1 with computing all the elements of the array

CRC32(byte[]) => **CRC32**(byte[], 0, Length(byte[]))

```
byte[] bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF}
```

```
value = CRC32(bb1,0,Length(bb1))    // value = {0x43, 0xD5, 0xB9, 0xF8}
```

```
value = CRC32(bb1,0)                // value = {0x43, 0xD5, 0xB9, 0xF8}
```

```
value = CRC32(bb1)                  // value = {0x43, 0xD5, 0xB9, 0xF8}
```

```
bb1 = Byte_Concat(bb1, CRC32(bb1)) // bb1 = {0x10, 0x20, 0x50, 0xF0, 0xFF, 0xFF, 0xFF, 0x43, 0xD5, 0xB9, 0xF8}
```

2.44 RMS_VarSync()

Send the Variable object to TM Manager (Robot Management System)

* When executing this function, the flow will not go forward until the object is sent out successfully or the maximum retry times is reached.

Syntax 1

```
int RMS_VarSync (
    int,
    int,
    ?
)
```

Parameters

int	The maximum retry times
<code><= 0</code>	Keep retrying as error occurred.
int	The time duration between two retries (millisecond)
<code>< 0</code>	Invalid time duration. The default value, 1000ms, will be applied
?	The string or string array. The name of variables to be sent.

Various items can be listed. The undefined variables will not be sent out, but the residual items will still be sent.

* The item is the name of the variable, not variable itself, e.g. "var_i" instead of var_i.

* If the variable is listed, the value of the variable will be use as the parameter to send the corresponding object

Return

int	Sending times
<code>> 0</code>	Send success. The return value represend the sending times
<code>0</code>	Send failed
<code>-1</code>	TM Manager function is not enabled
<code>-9</code>	Invalid Parameters

Note

```
string var_s = "ABC"
string var_s1 = "var_s"
string[] var_ss = {"ABC", "var_s", "var_s1"}
```

```
value = RMS_VarSync(1, 1000, "var_s")    // Send var_s variable object
value = RMS_VarSync(2, 2000, var_s)      // Send ABC variable object (Because the value of var_s is "ABC")
```

```
value = RMS_VarSync(3, 2000, var_ss)    // Send ABC, var_s, var_s1 variable object (From the value of var_ss
string array)
value = RMS_VarSync(3, 2000, "var_ss")  // Send var_ss variable object
value = RMS_VarSync(4, 2000, "var_ss", "var_s1", "ABC") // Send var_ss, var_s1, ABC variable object
```

Syntax 2

```
int RMS_VarSync (
    int,
    ?
)
```

Note

Similar to Syntax1 with 1000 ms retry time duration

RMS_VarSync(int, ?) => RMS_VarSync(int, 1000, ?)

Syntax 3

```
int RMS_VarSync (
    ?
)
```

Note

Similar to Syntax1 with 1000 ms retry time duration and no retry times limit

RMS_VarSync(?) => RMS_VarSync(0, 1000, ?)

2.45 ListenPacket()

To package the string into Listen Node compatible format

Syntax 1

```
string ListenPacket (  
    string,  
    string  
)
```

Parameters

string User defined Header. For empty string, Default string "TMSCT" will be applied

string The data section in Listen Node communication format

Return

string Packeted data (Including header, data length and check sum)

Note

```
string var_data1 = "ABC"
```

```
string var_data2 = "Hello World"
```

```
value = ListenPacket("TMSCT",var_data1)    // $TMSCT,3,ABC,*02\r\n  
value = ListenPacket("CPERR", var_data2)    // $CPERR,11,Hello World,*5A\r\n  
value = ListenPacket("", var_data2)         // $TMSCT,11,Hello World,*51\r\n  
value = ListenPacket("", "Techman Robot")   // $TMSCT,13,Techman Robot,*4F\r\n
```

Syntax 2

```
string ListenPacket (  
    string  
)
```

Parameters

string The data section in Listen Node communication format (With TMSCT header)

Return

string Packeted data (Including header, data length and check sum)

Note

```
string var_data1 = "Techman Robot"
```

```
value = ListenPacket(var_data1)    // $TMSCT,13,Techman Robot,*4F\r\n
```

3. Modbus Functions

3.1 modbus_read()

Modbus TCP/RTU read function

Syntax 1 (TCP/RTU)

```
? modbus_read(  
    string,  
    string  
)
```

Parameters

string TCP/RTU device name (Set in Modbus Device setting)

string The predefined parameters belong to TCP/RTU device (Set in Modbus Device setting)

Return

? The return data type is decided by the predefined parameters

Signal Type	Function Code	Type	Num Of Addr	Return data type
Digital Output	01	byte	1	byte (H: 1)(L: 0)
		bool	1	bool (H: true)(L: false)
Digital Input	02	byte	1	byte (H: 1)(L: 0)
		bool	1	bool (H: true)(L: false)
Register Output	03	byte	1	byte
		int16	1	int
		int32	2	int
		float	2	float
		double	4	double
		string	?	string
Register Input	04	bool	1	bool
		byte	1	byte
		int16	1	int
		int32	2	int
		float	2	float
		double	4	double
		string	?	string
		bool	1	bool

* According to the Little Endian (CD AB) or Big Endian (AB CD) setting, the int32, float, double data will

transformed automatically.

* string will follow the UTF8 data format transformation (Stop at 0x00)

Note

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the default values are applied in Preset Setting

preset_800	DO	800	byte	
preset_7202	DI	7202	bool	
preset_9000	RO	9000	string	4
preset_7001	RI	7001	float	Big-Endian (AB CD)

```
value = modbus_read("TCP_1", "preset_800") // value = 1           // DO 1 address = 1 bit
value = modbus_read("TCP_1", "preset_7202") // value = true       // DI 1 address = 1 bit
value = modbus_read("TCP_1", "preset_9000") // value = ab1234cd    // RO 4 address = 8 bytes size
value = modbus_read("TCP_1", "preset_7001") // value = -314.1593   // RI 2 address = 4 bytes size (float)
```

Syntax 2 (TCP/RTU)

```
byte[] modbus_read(
    string,
    byte,
    string,
    int,
    int
)
```

Parameters

string	TCP/RTU Device Name (Set in Modbus Device setting)		
byte	Slave ID		
string	Read type		
	DO	Digital Output	(Function Code : 01)
	DI	Digital Input	(Function Code : 02)
	RO	Register Output	(Function Code : 03)
	RI	Register Input	(Function Code : 04)
int	Starting address		

int Data length

Return

byte[] The returned byte array from modbus server
*User defined modbus_read only follows **Big-Endian (AB CD)** format to read byte[]

Note

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as

TCP device	0	DO	800	4
TCP device	0	DI	7202	3
TCP device	0	RO	9000	6
TCP device	0	RI	7001	12
TCP device	0	RI	7301	6

```
value = modbus_read("TCP_1", 0, "DO", 800, 4)
// value = {0,0,0,0}      // DO 4 address = 4 bit to byte array

value = modbus_read("TCP_1", 0, "DI", 7202, 3)
// value = {1,0,0}      // DI 3 address = 3 bit to byte array

value = modbus_read("TCP_1", 0, "RO", 9000, 6)
// value = {0x54,0x65,0x63,0x68,0x6D,0x61,0x6E,0xE9,0x81,0x94,0xE6,0x98} // RO 6 address = 12 bytes size

value = modbus_read("TCP_1", 0, "RI", 7001, 12)
// value = {0x29,0x30,0x9F,0x4C,0xC3,0x7C,0x99,0x9A,0x44,0x5E,0xEC,0xCD,0x42,0xB4,0x00,0x00,
0x80,0x00,0x00,0x00,0x00,0x00,0x00,0x00}      // RI 12 address = 24 bytes size

value = modbus_read("TCP_1", 0, "RI", 7301, 6)
// value = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x0F,0x00,0x0A,0x00,0x39} // RI 6 address = 12 bytes size
```

3.2 *modbus_read_int16()*

Modbus TCP/RTU read function, and transform modbus address data array to int16 array

Syntax 1 (TCP/RTU)

```
int[] modbus_read_int16(  
    string,  
    byte,  
    string,  
    int,  
    int,  
    int  
)
```

Parameters

string TCP/RTU Device Name (Set in Modbus Device setting)

byte Slave ID

string Read type

DO Digital Output (Function Code : 01)

DI Digital Input (Function Code : 02)

RO Register Output (Function Code : 03)

RI Register Input (Function Code : 04)

int Starting address

int Data length

int Follows Little Endian (CD AB) or Big Endian (AB CD) to transform the address data to int16 array. *Invalid Parameter. Only support int32, float, double

0 Little Endian

1 Big Endian (Default)

Return

int[] The returned int array from modbus server

Syntax 2 (TCP/RTU)

```
int[] modbus_read_int16(  
    string,  
    byte,  
    string,  
    int,  
    int  
)
```

Note

Similar to Syntax1 with Big Endian (AB CD) setting

modbus_read_int16("TCP_1", 0, "DI", 7200, 2) => **modbus_read_int16**("TCP_1", 0, "DI", 7200, 2, **1**)

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as

TCP device	0	DO	800	4
TCP device	0	DI	7202	3
TCP device	0	RO	9000	6
TCP device	0	RI	7001	12
TCP device	0	RI	7301	6

value = **modbus_read_int16**("TCP_1", 0, "DO", 800, 4)

// byte[] = {0,0,0,0} to int16[] value = {0,0} // byte[0][1] , byte[2][3]

value = **modbus_read_int16**("TCP_1", 0, "DI", 7202, 3)

// byte[] = {1,0,0} to int16[] value = {256,0} // byte[0][1] , byte[2][3] // Fill up to [3] automatically

value = **modbus_read_int16**("TCP_1", 0, "RO", 9000, 6)

// byte[] = {0x54,0x65,0x63,0x68,0x6D,0x61,0x6E,0xE9,0x81,0x94,0xE6,0x98}

// to int16[] value = {21605,25448,28001,28393,-32364,-6504}

value = **modbus_read_int16**("TCP_1", 0, "RI", 7001, 12)

// byte[] = {0x29,0x30,0x9F,0x4C,0xC3,0x7C,0x99,0x9A,0x44,0x5E,0xEC,0xCD,0x42,0xB4,0x00,0x00,
0x80,0x00,0x00,0x00,0x00,0x00,0x00,0x00}

// to int16[] value = {10544,-24756,-15492,-26214,17502,-4915,17076,0,-32768,0,0,0}

value = **modbus_read_int16**("TCP_1", 0, "RI", 7301, 6)

// byte[] = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x0F,0x00,0x31,0x00,0x23}

// to int16[] value = {2018,5,18,15,49,35}

value = **modbus_read_int16**("TCP_1", 0, "RI", 7301, 6, **0**)

// byte[] = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x0F,0x00,0x31,0x00,0x23}

// to int16[] value = {2018,5,18,15,49,35}

3.3 *modbus_read_int32()*

Modbus TCP/RTU read function, and transform modbus address data array to int32 array

Syntax 1 (TCP/RTU)

```
int[] modbus_read_int32 (  
    string,  
    byte,  
    string,  
    int,  
    int,  
    int  
)
```

Parameters

string	TCP/RTU DEVICE NAME (Set in Modbus Device setting)	
byte	Slave ID	
string	Read type	
	DO	Digital Output (Function Code : 01)
	DI	Digital Input (Function Code : 02)
	RO	Register Output (Function Code : 03)
	RI	Register Input (Function Code : 04)
int	Starting address	
int	Data length	
int	Follows Little Endian (CD AB) or Big Endian (AB CD) to transform the address data to int32 array.	
	0	Little Endian
	1	Big Endian (Default)

Return

int[] The returned int array from modbus server

Syntax 2 (TCP/RTU)

```
int[] modbus_read_int32 (  
    string,  
    byte,  
    string,  
    int,  
    int  
)
```

Note

Similar to Syntax1 with Big Endian (AB CD) setting.

modbus_read_int32("TCP_1", 0, "DI", 7200, 2) => **modbus_read_int32**("TCP_1", 0, "DI", 7200, 2, **1**)

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as

TCP device	0	DO	800	4
TCP device	0	DI	7202	3
TCP device	0	RO	9000	6
TCP device	0	RI	7001	12
TCP device	0	RI	7301	6

value = **modbus_read_int32**("TCP_1", 0, "DO", 800, 4)

// byte[] = {0,0,0,0} to int32[] value = {0} // byte[0][1][2][3]

value = **modbus_read_int32**("TCP_1", 0, "DI", 7202, 3)

// byte[] = {1,0,0} to int32[] value = {16777216} // byte[0][1][2][3] // Fill up to [3] automatically.

value = **modbus_read_int32**("TCP_1", 0, "RO", 9000, 6)

// byte[] = {0x54,0x65,0x63,0x68,0x6D,0x61,0x6E,0xE9,0x81,0x94,0xE6,0x98}

// to int32[] value = {1415930728,1835101929,-2120948072}

value = **modbus_read_int32**("TCP_1", 0, "RI", 7001, 12)

// byte[] = {0x29,0x30,0x9F,0x4C,0xC3,0x7C,0x99,0x9A,0x44,0x5E,0xEC,0xCD,0x42,0xB4,0x00,0x00,
0x80,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00}

// to int32[] value = {691052364,-1015244390,1147071693,1119092736,-2147483648,0}

value = **modbus_read_int32**("TCP_1", 0, "RI", 7301, 6)

// byte[] = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x0F,0x00,0x31,0x00,0x23}

// to int32[] value = {132251653,1179663,3211299}

value = **modbus_read_int32**("TCP_1", 0, "RI", 7301, 6, **0**) // byte[2][3][0][1]

// byte[] = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x0F,0x00,0x31,0x00,0x23}

// to int32[] value = {0x000507E2,0x000F0012,0x00230031} = {329698,983058,2293809}

3.4 *modbus_read_float()*

Modbus TCP/RTU read function, and transform modbus address data array to float array

Syntax 1 (TCP/RTU)

```
float[] modbus_read_float(  
    string,  
    byte,  
    string,  
    int,  
    int,  
    int  
)
```

Parameters

string	TCP/RTU DEVICE NAME (Set in Modbus Device setting)		
byte	Slave ID		
string	Read type		
	DO	Digital Output	(Function Code : 01)
	DI	Digital Input	(Function Code : 02)
	RO	Register Output	(Function Code : 03)
	RI	Register Input	(Function Code : 04)
int	Starting address		
int	Data length		
int	Follows Little Endian (CD AB) or Big Endian (AB CD) to transform the address data to float array.		
	0	Little Endian	
	1	Big Endian (Default)	

Return

float[] The returned float array from modbus server

Syntax 2 (TCP/RTU)

```
float[] modbus_read_float(  
    string,  
    byte,  
    string,  
    int,  
    int  
)
```

Note

Similar to Syntax1 with Big Endian (AB CD) setting.

modbus_read_float("TCP_1", 0, "DI", 7200, 2) => **modbus_read_float**("TCP_1", 0, "DI", 7200, 2, **1**)

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as

TCP device	0	DO	800	4
TCP device	0	DI	7202	3
TCP device	0	RO	9000	6
TCP device	0	RI	7001	12
TCP device	0	RI	7301	6

value = **modbus_read_float**("TCP_1", 0, "DO", 800, 4)

// byte[] = {0,0,0,0} to float[] value = {0} // byte[0][1][2][3]

value = **modbus_read_float**("TCP_1", 0, "DI", 7202, 3)

// byte[] = {1,0,0} to float[] value = {2.350989E-38} // byte[0][1][2][3] // Fill up to [3] automatically.

value = **modbus_read_float**("TCP_1", 0, "RO", 9000, 6)

// byte[] = {0x54,0x65,0x63,0x68,0x6D,0x61,0x6E,0xE9,0x81,0x94,0xE6,0x98}

// to float[] value = {3.940861E+12,4.360513E+27,-5.46975E-38}

// to float[] value = {0x9F4C2930,0x999AC37C,0xECCD445E,0x000042B4,0x00008000,0x00000000}
= {-4.323275E-20,-1.600218E-23,-1.985221E+27,2.392857E-41,4.591775E-41,0}

value = **modbus_read_float**("TCP_1", 0, "RI", 7301, 6)

// byte[] = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x0F,0x00,0x3A,0x00,0x26}

// to float[] value = {3.400471E-34,1.65306E-39,5.326512E-39}

3.5 *modbus_read_double()*

Modbus TCP/RTU read function, and transform modbus address data array to double array

Syntax 1 (TCP/RTU)

```
double[] modbus_read_double (  
    string,  
    byte,  
    string,  
    int,  
    int,  
    int  
)
```

Parameters

string	TCP/RTU DEVICE NAME (Set in Modbus Device setting)	
byte	Slave ID	
string	Read type	
	DO	Digital Output (Function Code : 01)
	DI	Digital Input (Function Code : 02)
	RO	Register Output (Function Code : 03)
	RI	Register Input (Function Code : 04)
int	Starting address	
int	Data length	
int	Follows Little Endian (CD AB) or Big Endian (AB CD) to transform the address data to double array.	
	0	Little Endian
	1	Big Endian (Default)

Return

double[] The returned double array from modbus server

Syntax 2 (TCP/RTU)

```
double[] modbus_read_double (  
    string,  
    byte,  
    string,  
    int,  
    int  
)
```

Note

Similar to Syntax1 with Big Endian (AB CD) setting.

modbus_read_double("TCP_1", 0, "DI", 7200, 2) => **modbus_read_double**("TCP_1", 0, "DI", 7200, 2, **1**)

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as

TCP device	0	DO	800	4
TCP device	0	DI	7202	3
TCP device	0	RO	9000	6
TCP device	0	RI	7001	12
TCP device	0	RI	7301	6

value = **modbus_read_double**("TCP_1", 0, "DO", 800, 4)

// byte[] = {0,0,0,0} to double[] value = {0} // byte[0][1][2][3][4][5][6][7]

value = **modbus_read_double**("TCP_1", 0, "DI", 7202, 3)

// byte[] = {1,0,0} to double[] value = {7.2911220195564E-304} // byte[0][1][2][3][4][5][6][7]

value = **modbus_read_double**("TCP_1", 0, "RO", 9000, 6)

// byte[] = {0x54,0x65,0x63,0x68,0x6D,0x61,0x6E,0xE9,0x81,0x94,0xE6,0x98}

// to double[] value = {3.65481260356117E+98,-4.87647898854073E-301}

value = **modbus_read_double**("TCP_1", 0, "RI", 7001, 12)

// byte[] = {0x29,0x30,0x9F,0x4C,0xC3,0x7C,0x99,0x9A,0x44,0x5E,0xEC,0xCD,0x42,0xB4,0x00,0x00,
0x80,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00,0x00}

// to double[] value = {2.76472410615396E-110,2.2818627604613E+21,0}

value = **modbus_read_double**("TCP_1", 0, "RI", 7001, 12, **0**) // byte[6][7][4][5][2][3][0][1]

// to double[] value = {0x999AC37C9F4C2930,0x000042B4ECCD445E,0x0000000000008000}
= {-2.4604103205376E-185,3.62371629877526E-310,1.6189543082926E-319}

value = **modbus_read_double**("TCP_1", 0, "RI", 7301, 6)

// byte[] = {0x07,0xE2,0x00,0x05,0x00,0x12,0x00,0x10,0x00,0x0B,0x00,0x29}

// to double[] value = {1.06475148078395E-270,1.52982527955113E-308}

3.6 *modbus_read_string()*

Modbus TCP/RTU read function, and transform modbus address data array to string text by UTF8

Syntax 1 (TCP/RTU)

```
string modbus_read_string(  
    string,  
    byte,  
    string,  
    int,  
    int,  
    int  
)
```

Parameters

string	TCP/RTU DEVICE NAME (Set in Modbus Device setting)		
byte	Slave ID		
string	Read type		
	DO	Digital Output	(Function Code : 01)
	DI	Digital Input	(Function Code : 02)
	RO	Register Output	(Function Code : 03)
	RI	Register Input	(Function Code : 04)
int	Starting address		
int	Data length		
int	Follows Little Endian (CD AB) or Big Endian (AB CD) to transform the address data to string. *Invalid Parameter. Only support int32, float, double. String follows UTF8 and is sequentially transferred according to address.		
	0	Little Endian	
	1	Big Endian (Default)	

Return

string The returned UTF8 string from modbus server (Stop at 0x00)

Syntax 2 (TCP/RTU)

```
string modbus_read_string(  
    string,  
    byte,  
    string,  
    int,  
    int
```

)

Note

Similar to Syntax1 with Big Endian (AB CD) setting.

modbus_read_string("TCP_1", 0, "RO", 9000, 2) => **modbus_read_string**("TCP_1", 0, "RO", 9000, 2, 1)

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as

TCP device	0	RO	9000	12
------------	---	----	------	----

modbus_write("TCP_1", 0, "RO", 9000) = "1234 達明機器手臂"

// Undefined number of address to write, the default value 0 means write the whole data

// Write byte[] = {0x31,0x32,0x33,0x34,0xE9,0x81,0x94,0xE6,0x98,0x8E,
0xE6,0x9C,0xBA,0xE5,0x99,0xA8,0xE6,0x89,0x8B,0xE8,0x87,0x82}

value = **modbus_read_string**("TCP_1", 0, "RO", 9000, 3)

// byte[] = {0x31,0x32,0x33,0x34,0xE9,0x81} // RO 3 address = 6 bytes size

// to string = 1234

value = **modbus_read_string**("TCP_1", 0, "RO", 9000, 6)

// byte[] = {0x31,0x32,0x33,0x34,0xE9,0x81,0x94,0xE6,0x98,0x8E,0xE6,0x9C}

// to string = 1234 達明

value = **modbus_read_string**("TCP_1", 0, "RO", 9000, 12)

// byte[] = {0x31,0x32,0x33,0x34,0xE9,0x81,0x94,0xE6,0x98,0x8E,
0xE6,0x9C,0xBA,0xE5,0x99,0xA8,0xE6,0x89,0x8B,0xE8,0x87,0x82, 0x41,0x42}

// to string = 1234 達明機器手臂 AB // UTF8 format transformation

// The ending, 0x00, will not be included when writing data. When reading 12 addresses, the data out of the range set in first step will be captured

modbus_write("TCP_1", 0, "RO", 9000) = "1234"+Ctrl("\0")

// Write byte[] = {0x31,0x32,0x33,0x34,0x00} // Needs to write 3 Register address

value = **modbus_read_string**("TCP_1", 0, "RO", 9000, 5)

// byte[] = {0x31,0x32,0x33,0x34,0x00,0x00, 0x94,0xE6,0x98,0x8E} // The last 4 values are the original data at those addresses

```
// to string = 1234    // UTF8 format transformation stops at 0x00
```

3.7 modbus_write()

Modbus TCP/RTU write function

Syntax 1 (TCP/RTU)

```
bool modbus_write(  
    string,  
    string,  
    ?,  
    int  
)
```

Parameters

string TCP/RTU Device Name (Set in Modbus Device setting)

string TCP/RTU The predefined parameters belong to TCP/RTU device (Set in Modbus Device setting)

? The input data. The predefined parameters will be applied according to the table below.

Signal Type	Function Code	Type	Input ? type	Input value
Digital Output	05	byte	byte	(H: 1)(L: 0)
		bool	bool	(H: true)(L: false)
Register Output	06	byte	byte	
		bool	bool	
		int16	int	
Register Output	16	int32	int	
		float	float	
		double	double	
		string	string	

* int32, float, double will be transferred with Little Endian (CD AB) or Big Endian (AB CD) according to user's setting.

* string will be transferred with UTF8 format

* Writing array value is not supported with predefined parameters. To write with the array value, user defined method should be applied (Syntax 3/4)

int The maximum number of addresses to be write, only effective to string type data

> 0 Valid address length. Write with defined address length

<= 0 Invalid address length. Write all the data

When this parameter is skipped (As shown in Syntax2), the predefined address length will be applied.

Return

bool **True** Write success

False

Write failed

1. If the input data ? is empty string or array
2. If an error occurred in Modbus communication

Syntax 2 (TCP/RTU)

```
bool modbus_write(  
    string,  
    string,  
    ?,  
)
```

Note

Similar to Syntax1 with predefined address length to write. If the predefined address length ≤ 0 , it will write all the data.

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as as

preset_800	DO	800	bool	
preset_9000	RO	9000	string	4

```
modbus_write("TCP_1", "preset_800", 1)    // write 1 (true)
```

```
modbus_write("TCP_1", "preset_800", 0)    // write 0 (false)
```

```
bool flag = true
```

```
modbus_write("TCP_1", "preset_800", flag)  // write 1 (true)
```

```
modbus_write("TCP_1", "preset_800", false) // write 0 (false)
```

```
string ss = "ABCDEFGHJKLMNOPQRST"
```

```
// With no number of address, the predefined address length, 4, is applied. That is 4 RO = 8 bytes size can be wrote.
```

```
modbus_write("TCP_1", "preset_9000", ss)    // write ABCDEFGH    // The exceeding part will be  
skipped
```

```
// With no number of address, the predefined address length, 4, is applied. That is 4 RO = 8 bytes size can be wrote.
```

```
modbus_write("TCP_1", "preset_9000", "1234567") // write 1234567\0 // Use 0x00 to fill up 4 address
```

```
// With address length = 0, write all the data. "09AB123" needs 4 addresses.
```

```
modbus_write("TCP_1", "preset_9000", "09AB123", 0) // write 09AB123\0 // Use 0x00 to fill up 4 address
```

```
// With address length = 5, write data in 5 addresses. That is 5 RO = 10 bytes size can be wrote.
```

modbus_write("TCP_1", "preset_9000", "09AB1234", 5) // write 09AB1234 // The input data needs only 4 addresses.

Syntax 3 (TCP/RTU)

```
bool modbus_write(  
    string,  
    byte,  
    string,  
    int,  
    ?,  
    int  
)
```

Parameters

string TCP/RTU DEVICE NAME (Set in Modbus Device setting)

byte Slave ID

string Write type

DO Digital Output (Function Code : 05/15)

RO Register Output (Function Code : 06/16)

int Starting address

? Input data

Signal Type	Function Code	Input ? type	Input value
Digital Output	05	byte	(H: 1)(L: 0)
		bool	(H: true)(L: false)
Digital Output	15	byte[]	(H: 1)(L: 0)
		bool[]	(H: true)(L: false)
Register Output	06	byte	
		bool	
Register Output	16	int	
		float	
		double	
		string	
		byte[]	
		int[]	
		float[]	
		double[]	
		string[]	
		bool[]	

*User defined modbus_write will follows **Big-Endian (AB CD)** format to write

* Here int means int32. For int16 type data, GetBytes() needs to be applied first to change int16 to byte[]

int The maximum number of addresses to be write, only effective to string type data

> 0 Valid address length. Write with defined address length

`<= 0` Invalid address length. Write all the data

Return

<code>bool</code>	<code>True</code>	Write success	
	<code>False</code>	Write failed	1. If the input data ? is empty string or array 2. If an error occurred in Modbus communication

Syntax 4 (TCP/RTU)

```
bool modbus_write(  
    string,  
    byte,  
    string,  
    int,  
    ?  
)
```

Note

Similar to Syntax3 with address length `<= 0`, it will write all the data.

`modbus_write("TCP_1", 0, "RO", 9000, bb) => modbus_write("TCP_1", 0, "RO", 9000, bb, 0)`

Modbus Address data size

Digital	1 address = 1 bit size
Register	1 address = 2 bytes size

If the user defined values are applied to User Setting as as

TCP device	0	DO	800	4
TCP device	0	RO	9000	12

```
byte[] bb = {10, 20, 30}
```

```
modbus_write("TCP_1", 0, "DO", 800, bb) // write 1,1,1 // Zero value, write 0. Non-zero value, write 1.
```

```
modbus_write("TCP_1", 0, "DO", 800, bb, 2) // write 1,1 // Address number = 2, only write 2 addresses.
```

```
modbus_write("TCP_1", 0, "DO", 800, true) // write 1
```

```
int i = 10000
```

```
modbus_write("TCP_1", 0, "RO", 9000, i) // write 0x00,0x00,0x27,0x10// with int32 BigEndian (AB CD) default
```

```
bb = GetBytes(i, 0, 1) // bb = {0x10,0x27} // transfer to int16 LittleEndian (CD AB)
```

```
modbus_write("TCP_1", 0, "RO", 9000, bb)// write 0x10,0x27
```

```
string[] n = {"ABC", "12", "34"}
```

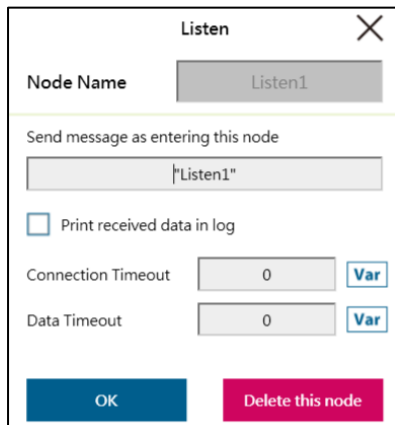

modbus_write("TCP_1", 0, "RO", 9000, n, 2) // write ABC1 // Only 2 addresses available, the exceeding values cannot be applied.

modbus_write("TCP_1", 0, "RO", 9000, n, 5) // write ABC1234\0 // The data needs only 4 addresses

4. External Script

4.1 Listen Node

In the Listen Node, a TCP/IP server (Socket Server) can be established and be connected by an external device to communicate according to the defined format. All the functions available in "Expression Editor" can also be executed in Listen Node.

The screenshot shows the 'Listen' dialog box with the following fields and controls:

- Node Name:** A text field containing 'Listen1'.
- Send message as entering this node:** A text field containing 'Listen1'.
- Print received data in log:** An unchecked checkbox.
- Connection Timeout:** A numeric field set to '0' with a 'Var' button.
- Data Timeout:** A numeric field set to '0' with a 'Var' button.
- Buttons:** 'OK' (blue) and 'Delete this node' (pink).

- **Send Message:** When entering this node, it will initiate a message
- **Print Log:** Enable Communication Log (shown on the right)
- **Connection Timeout:** When entering this node, if more than the time (milliseconds) is not connected, it will be overtime.
If ≤ 0 , no timeout
- **Data Timeout:** When connected, the timeout will be exceeded when there is no communication packet
If ≤ 0 , no timeout

Socket TCPListener is started up after the project being executed, and closed as the project stopped. The IP and listen port will be shown on the Notice Log window on the right, after the Socket TCPListener is started up.

IP HMI → System → Network → IP Address

Port 5890

When entering the Listen Node, the flow will keep at Listen Node until either of the the two exit conditions is fulfilled.

Pass: *ScriptExit()* is executed or the project is stopped

- Fail:**
1. Connection Timeout
 2. Data Timeout
 3. Before the TCP Listener is started up, the flow has entered this Listen Node

The command received by listen node will be executed in order. If the command is not valid, an error message will be returned carrying the line number with errors. If the command is valid, it will be executed.

The command can be divided into two categories. The fist category is commands which can be accomplished in instance, like assigning variable value. The second category is commands needs to be executed in sequence, like motion command and IO value assigning. The second category command will be placed in queue and executed in order.

4.2 ScriptExit()

Exit external control mode.

Syntax 1

```
bool ScriptExit(  
)
```

Parameters

`void` No parameter

Return

`bool` `True` Command accepted; `False` Command rejected (formate error)

Note

Exit the Listen Node through pass terminal

4.3 Communication Protocol

Name	Size	ASCII	HEX	Description
Start Byte	1	\$	0x24	Start Byte for Communication
Header	X			Header for Communication
Separator	1	,	0x2C	Separator between Header and Length
Length	Y			Length of Data
Separator	1	,	0x2C	Separator between Length and Data
Data	Z			Communication Data
Separator	1	,	0x2C	Separator between Data and Checksum
Sign	1	*	0x2A	Begin Sign of Checksum
Checksum	2			Checksum of Communication
End Byte 1	1	\r	0x0D	
End Byte 2	1	\n	0x0A	End Byte of Communication

1. Header

Defines the purpose of the communication package. The data definition could be different with different Header.

- **TMSC** External Script
- **TMSTA** Acquiring status or properties
- **CPERR** Communication data error (E.g. Packet error, checksum error, header error, etc.)

2. Length

Length defines the length in UTF8 byte. It can be represented in decimal, hexadecimal or binary, the upper limit is int 32bits

Example:

```
$TMSCT,100,Data,*CS\r\n    // Decimal 100, that is the data length is 100 bytes
$TMSCT,0x100,Data,*CS\r\n  // Hexadecimal 0x100, that is the data length is 256 bytes
$TMSCT,0b100,Data,*CS\r\n  // Binary 0b100, that is the data length is 4 bytes
$TMSCT,8,1,達明,*58\r\n    // The Data length 1,達明 is 8 bytes (UTF8)
```

3. Data

The content of the communication package. Arbitrary characters are supported (including 0x00 .. 0xFF in UTF8).

The data length is defined in Length and the purpose is defined in Header

4. Checksum

The checksum of the communication package. The checksum is calculated with XOR(exclusive OR), and the range for checksum computation starts from \$ to * (\$ and * are excluded) as shown below:

```
$TMSCT,100,Data,*CS\r\n
```

Checksum = Byte[1] ^ Byte[2] ... ^ Byte[N-6]

The representation of checksum is fixed to 2 bytes in hexadecimal format (without 0x).

For example:

```
$TMSCT,5,10,OK,*6D
```

CS = 0x54 ^ 0x4D ^ 0x53 ^ 0x43 ^ 0x54 ^ 0x2C ^ 0x35 ^ 0x2C ^ 0x31 ^ 0x30 ^ 0x2C ^ 0x4F ^ 0x4B ^ 0x2C = 0x6D

CS = 6D (0x36 0x44)

4.4 TMSCT

Start Byte	Hdr		Len		Data			Checksum	End Byte1	End Byte2
\$	TMSCT	,	Length	,	Data	,	*	Checksum	\r	\n

ID		SCRIPT
Script ID	,	Script Language

TMSCT defines the communication package as External Script Language. In External Script Language, the data contains two parts and is separated by comma. One is ID and the other is SCRIPT

- ID** Script ID, can be arbitrary English character or number (the invalid byte will be ignored). The ID is used as specifying the target SCRIPT of return message.
- ,** Separator
- SCRIPT** The content defined in Script Language. In a communication package, multi-line scripts can fit into the SCRIPT section with separator (0x0D 0x0A)

Note

TMSCT is functional only when flow enters the Listen Node

Return (Robot→External Device)

- When flow enters Listen Node, robot will send a message to all the connected device. The ID is set to 0.
\$TMSCT,9,0,Listen1,*4C\r\n
 - 9** The length of *0,Listen1* is 9 bytes
 - 0** The Script ID is 0
 - ,** Separator
 - Listen1** The message to send
- The OK or ERROR returning message according to the Script's content. For message with **;N, ;N** represents the number of line with error or warning. *After the message is received, robot will execute the message, then send back the return message, if the Script is valid. For invalid Script, the return message will be sent back immediately without executed.*

\$TMSCT,4,1,OK,*5C\r\n // Response to ID 1
// OK means valid Script.
\$TMSCT,8,2,OK;2;3,*52\r\n // Response to ID 2
// OK;2;3 means valid Script with warnings in line 2 and 3.

`$TMSCT,13,3,ERROR;1;2;3,*3F\r\n` // Response to ID 3

// ERROR;1;2;3 means invalid Script with errors in line 1, 2 and 3.

Receive (Robot←External Device)

1. When flow enters Listen Node, the robot will start to receive, check and execute the Script. The Script received before entering Listen Node will be disposed without response.
2. The message from external device should contain the Script ID as a ID used in return message by robot.

< `$TMSCT,25,1,ChangeBase("RobotBase"),*08\r\n` // Defined as ID 1

> `$TMSCT,4,1,OK,*5C\r\n` // Response to ID 1

3. In a communication package, multi-line scripts can fit into the SCRIPT section with separator `\r\n`

< `$TMSCT,64,2,ChangeBase("RobotBase")\r\n`

`ChangeTCP("NOTOOL")\r\n`

`ChangeLoad(10.1),*68\r\n` // Three lines Script in a communication package (Lines are separated by `\r\n`)

> `$TMSCT,4,2,OK,*5F\r\n`

4. In Listen Node, Local variables are supported. The local variable in Listen Node will vanish after exiting the Listen Node.

< `$TMSCT,40,3,int var_i = 100\r\n`

`var_i = 1000\r\n`

`var_i++,*5A\r\n`

> `$TMSCT,4,3,OK,*5E\r\n`

< `$TMSCT,42,4,int var_i = 100\r\n`

`var_i = 1000\r\n`

`var_i++\r\n`

`,*58\r\n`

> `$TMSCT,9,4,ERROR;1,*02\r\n` // Because int var_i has been declared, an error occurred.

5. In Listen Node, it is possible to access or modify the project's variables, but no new variable can be declared. The variables created in the Listen Node are local variables.

4.5 TMSTA

Start Byte	Hdr		Len		Data			Checksum	End Byte1	End Byte2
\$	TMSTA	,	Length	,	Data	,	*	Checksum	\r	\n

SubCmd		
SubCmd

(Based on SubCmd)

TMSTA defines the communication package as acquiring status or properties. The data section of the package contains different sub command (SubCMD). The package format could be different according to different SubCMD. The definitions are listed below.

SubCmd

00 Whether the flow enters Listen Node.

Note

TMSTA could be executed without entering the Listen Node

SubCmd 00 Whether the flow enters Listen Node

Format

Response (Robot→External Device)

SubCmd		Entry		Message
00	,	false	,	
00	,	true	,	message

Receive (Robot←External Device)

SubCmd
00

Response (Robot→External Device)

1. If the flow have not entered Listen Node

\$TMSTA,9,00,false,,*37\r\n

- 9 Indicates the length of 00,false, is 9 bytes
- 00 Indicates SubCmd as 00
- ,
- Separator
- false The flow has not entered Listen Node
- ,
- Separator

Empty string (Have not entered Listen Node)

2. If the flow have entered the Listen Node

`$TMSTA,15,00,true,Listen1,*79\r\n`

15	Indicates the length of 00,true,Listen1 is 15 bytes
00	Indicates SubCmd as 00
,	Separator
true	The flow has entered the Listen Node
,	Separator
Listen1	The message to be sent as entering Listen Node (It indicates the flow is in Listen1)

Receive (Robot←External Device)

1. Send to robot from external device

`$TMSTA,2,00,*41\r\n`

2	Indicates the length of 00 is 2 bytes.
00	Indicates the SubCmd is 00, whether entering the Listen Node mode.

4.6 CPERR

CPERR defines the communication package as sending the Communication Protocol Error. The data section is defined as Error Code.

Error Code	Error code, presented in 2 bytes hexadecimal format (without 0x)
00	Packet correct. No error. (The return message usually reply to the content of packet instead of returning no error)
01	Packet Error.
02	Checksum Error.
03	Header Error.
04	Packet Data Error.
F1	Have not entered Listen Node

Note

Used by robot to response to external device

Response (Robot→External Device)

01	Packet Error	
<	\$TMSCT,-100,1,ChangeBase("RobotBase"),*13\r\n	// Length cannot be negative
>	\$CPERR,2,01,*49\r\n	// CPERR Error Code 01
02	Checksum Error	
<	\$TMSCT,25,1,ChangeBase("RobotBase"),*09\r\n	// 09 is not a correct Checksum
>	\$CPERR,2,02,*4A\r\n	// CPERR Error Code 02
03	Header Error	
<	\$TMSct,25,1,ChangeBase("RobotBase"),*28\r\n	// TMsct is not a correct Header
>	\$CPERR,2,03,*4B\r\n	// CPERR Error Code 03
04	Packet Data Error	
<	\$TMSTA,4,XXXX,*47\r\n	// There is no XXXX SubCmd under TMSTA

> \$CPERR,2,04,*4C\r\n // CPERR Error Code 04

F1 No Listen

< \$TMSCT,25,1,ChangeBase("RobotBase"),*0D\r\n // Have not entered Listen Node

> \$CPERR,2,F1,*3F\r\n // CPERR Error Code F1

5. Robot Motion Functions

Robot Motion Function can only be executed after entering Listen Node.

5.1 PTP()

Define and send PTP motion command into buffer for execution.

Syntax 1

```
bool PTP (  
    string,  
    float[],  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters
#1: Motion target format:
 "J" expressed in joint angles
 "C" expressed in Cartesian coordinate
#2: Speed format:
 "P" expressed as a percentage
#3: Blending format
 "P" expressed as a percentage
float[] Motion target ° If defined with joint angle, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°) ; If defined with Cartesian coordinate, it includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)
int The speed setting, expressed as a percentage (%)
int The time interval to accelerate to top speed (ms)
int Blending value, expressed as a percentage (%)
bool Disable precise positioning
 true Disable precise positioning
 false Enable precise positioning

Return

bool **True** Command accepted ; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "JPP", (2) "CPP"

```
float[] targetP1= {0,0,90,0,90,0}           // Declare a float array to store the target coordinate
PTP("JPP",targetP1,10,200,0,false)           // Move to targetP1 with PTP, speed = 10%, time to top
                                              speed = 200ms.
```

Syntax 2

```
bool PTP (
    string,
    float[],
    int,
    int,
    int,
    bool,
    int[]
)
```

Parameters

string Definition of data format, combines three letters

- #1: Motion target format:
 - "C" expressed in Cartesian coordinate
- #2: Speed format:
 - "P" expressed as a percentage
- #3: Blending format
 - "P" expressed as a percentage

float[] Motion target. If defined with Cartesian coordinate, it includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed as a percentage (%)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

bool Disable precise positioning

- true** Disable precise positioning
- false** Enable precise positioning

int[] The pose of robot : [Config1, Config2, Config3], please find more information in appendix

Return

bool True Command accepted ; False Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP"

```

float[] targetP1 = {417.50,-122.30,343.90,180.00,0.00,90.00} // Declare a float array to store the target
coordinate.
float[] pose = {0,2,4} // Declare a float array to store pose.
PTP("CPP",targetP1,50,200,0,false,pose) // Move to targetP1 with PTP, speed = 50%,
time to top speed = 200ms.

```

Syntax 3

```

bool PTP (
    string,
    float, float, float, float, float, float,
    int,
    int,
    int,
    bool
)

```

Parameters

string Definition of data format, combines three letters

- #1: Motion target format:
 - "J" expressed in joint angles
 - "C" expressed in Cartesian coordinate
- #2: Speed format:
 - "P" expressed as a percentage
- #3: Blending format:
 - "P" expressed as a percentage

float, float, float, float, float, float

Motion target. If expressed in joint angles, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°) ; If expressed in Cartesian coordinate, it includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed as a percentage (%)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

bool Disable precise positioning

- true** Disable precise positioning
- false** Enable precise positioning

Return

bool True Command accepted ; False Command rejected (formate error)

Note

Data format parameter includes: (1) "JPP" and (2) "CPP"

PTP("JPP",0,0,90,0,90,0,35,200,0,false)

// Move to joint angle 0,0,90,0,90,0 with PTP,
speed = 35%, time to top speed = 200ms.

Syntax 4

```
bool PTP (  
    string,  
    float, float, float, float, float, float,  
    int,  
    int,  
    int,  
    bool,  
    int, int, int  
)
```

Parameters

string Definition of data format, combines three letters

#1: Motion target format:

"C" expressed in Cartesian coordinate

#2: Speed format:

"P" expressed as a percentage

#3: Blending format:

"P" expressed as a percentage

float, float, float, float, float, float

Motion target. It includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed as a percentage (%)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

bool Disable precise positioning

true Disable precise positioning

false Enable precise positioning

int, int, int

The pose of robot : Config1, Config2, Config3, please find more information in appendix

Return

bool True Command accepted ; False Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP"

PTP("CPP",417.50,-122.30,343.90,180.00,0.00,90.00,10,200,0,false,0,2,4) // Move to coordinate 417.50,-122.30,343.90,180.00,0.00,90.00, with PTP, speed = 10%, time to top speed = 200ms, pose = 024.

5.2 Line()

Define and send Line motion command into buffer for execution.

Syntax 1

```
bool Line (  
    string,  
    float[],  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters
#1: Motion target format:
 "C" expressed in Cartesian coordinate
#2: Speed format:
 "P" expressed as a percentage
 "A" expressed in velocity (mm/s)
#3: Blending format:
 "P" expressed as a percentage
 "R" expressed in radius
float[] Motion target. It includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)
int The speed setting, expressed as a percentage (%) or in velocity (mm/s)
int The time interval to accelerate to top speed (ms)
int Blending value, expressed as a percentage (%) or in radius (mm)
bool Disable precise positioning
 true Disable precise positioning
 false Enable precise positioning

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP", (2) "CPR", (3) "CAP" 與 (4) "CAR"

```
float[] Point1 = {417.50,-122.30,343.90,180.00,0.00,90.00} // Declare a float array to store the target  
                                                         coordinate
```

```
Line("CAR",Point1,100,200,50,false) // Move to Point1 with Line, speed = 100mm/s,
```

time to top speed = 200ms, blending radius = 50mm

Syntax 2

```
bool Line(  
    string,  
    float, float, float, float, float, float,  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters

- #1: Motion target format:
 - "C" expressed in Cartesian coordinate
- #2: Speed format:
 - "P" expressed as a percentage
 - "A" expressed in velocity (mm/s)
- #3: Blending format:
 - "P" expressed as a percentage
 - "R" expressed in radius

float, float, float, float, float, float

Motion target. It includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed as a percentage (%) or in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%) or in radius (mm)

bool Disable precise positioning

- true** Disable precise positioning
- false** Enable precise positioning

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP", (2) "CPR", (3) "CAP" 與 (4) "CAR"

```
Line("CAR", 417.50,-122.30,343.90,180.00,0.00,90.00,100,200,50,false) // Move to 417.50,-  
122.30,343.90,180.00,0.00,90.00  
with Line, velocity = 100mm/s,  
time to top speed = 200ms,  
blending radius = 50mm
```

5.3 Circle()

Define and send Circle motion command into buffer for execution.

Syntax 1

```
bool Circle(  
    string,  
    float[],  
    float[],  
    int,  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters
#1: Motion target format:
 "C" expressed in Cartesian coordinate
#2: Speed format:
 "P" expressed as a percentage
 "A" expressed in velocity (mm/s)
#3: Blending format:
 "P" expressed as a percentage

float[] A point on arc. It includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

float[] The end point of arc, it includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed as a percentage (%) or in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

int Arc angle(°), If non-zero value is given, the TCP will keep the same pose and move from current point to the assigned arc angle via the given point and end point on arc; If zero is given, the TCP will move from current point and pose to end point and pose via the point on arc with linear interpolation on pose.

bool Disable precise positioning
 true Disable precise positioning
 false Enable precise positioning

Return

`bool` `True` Command accepted; `False` Command rejected (formate error)

Note

Data format parameter includes: (1) `"CPP"` and (2) `"CAP"`

```
float[] PassP = {417.50,-122.30,343.90,180.00,0.00,90.00}    // Declare a float array to store the via point
                                                             value
float[] EndP = {381.70,208.74,343.90,180.00,0.00,135.00}    // Declare a float array to store the end point
                                                             value
Circle("CAP",PassP,EndP,100,200,50,270,false)              // Move on 270° arc, velocity = 100mm/s,
                                                             time to top speed = 200ms, blending value =
                                                             50%
```

Syntax 2

```
bool Circle(
    string,
    float, float, float, float, float, float,
    float, float, float, float, float, float,
    int,
    int,
    int,
    int,
    bool
)
```

Parameters

`string` Definition of data format, combines three letters

#1: Motion target format:

`"C"` expressed in Cartesian coordinate

#2: Speed format:

`"P"` expressed as a percentage

`"A"` expressed in velocity (mm/s)

#3: Blending format:

`"P"` expressed as a percentage

`float, float, float, float, float, float`

A point on arc. It includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

`float, float, float, float, float, float`

The end point of arc. It includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

<code>int</code>	The speed setting, expressed as a percentage (%) or in velocity (mm/s)
<code>int</code>	The time interval to accelerate to top speed (ms)
<code>int</code>	Blending value, expressed as a percentage (%)
<code>int</code>	Arc angle(°), If non-zero value is given, the TCP will keep the same pose and move from current point to the assigned arc angle via the given point and end point on arc; If zero is given, the TCP will move from current point and pose to end point and pose via the point on arc with linear interpolation on pose.
<code>bool</code>	Disable precise positioning
<code>true</code>	Disable precise positioning
<code>false</code>	Enable precise positioning

Return

`bool` `True` Command accepted; `False` Command rejected (formate error)

Note

Data format parameter includes: (1) `"CPP"` and (2) `"CAP"`

```
Circle("CAP", 417.50,-122.30,343.90,180.00,0.00,90.00,
      381.70,208.74,343.90,180.00,0.00,135.00,100,200,50,270,false)
// Move on 270° arc, velocity = 100mm/s, time to top speed = 200ms, blending value = 50%, via point =
417.50,-122.30,343.90,180.00,0.00,90.00, end point = 381.70,208.74,343.90,180.00,0.00,135.00
```

5.4 PLine()

Define and send PLine motion command into buffer for execution.

Syntax 1

```
bool PLine(  
    string,  
    float[],  
    int,  
    int,  
    int  
)
```

Parameters

string Definition of data format, combines three letters

#1: Motion target format:

"J": expressed in joint angles

"C": expressed in Cartesian coordinate

#2: Speed format:

"A" expressed in velocity (mm/s)

#3: Blending format:

"P" expressed as a percentage

float[] Motion target. If expressed in joint angles, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°) ; If expressed in Cartesian coordinate, it includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

Return

bool True Command accepted ; False Command rejected (formate error)

Note

Data format parameter includes: (1) "JAP" and (2) "CAP"

```
float[] targetP1 = {417.50,-122.30,343.90,180.00,0.00,90.00}
```

// Declare a float array to store the
target coordinate

```
PLine("CAP",targetP1,100,200,50,false)
```

// Move to targetP1 with PLine,
velocity = 100mm/s, time to top speed
= 200ms, blending value = 50%

Syntax 2

```
bool PLine (  
    string,  
    float, float, float, float, float, float,  
    int,  
    int,  
    int  
)
```

Parameters

string Definition of data format, combines three letters

#1: Motion target format:

 "J": expressed in joint angles

 "C": expressed in Cartesian coordinate

#2: Speed format:

 "A" expressed in velocity (mm/s)

#3: Blending format:

 "P" expressed as a percentage

float, float, float, float, float, float,

Motion target. If expressed in joint angles, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°) ; If expressed in Cartesian coordinate, it includes the Cartesian coordinate of tool center point: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm)

int The speed setting, expressed in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "JAP" and (2) "CAP"

PLine("CAP", 417.50,-122.30,343.90,180.00,0.00,90.00,100,200,50,false)

// Move to 417.50,-122.30,343.90,180.00,0.00,90.00 with PLine, velocity = 100mm/s, time to top speed = 200ms, Blending value = 50%

5.5 Move_PTP()

Define and send PTP relative motion command into buffer for execution.

Syntax 1

```
bool Move_PTP(  
    string,  
    float[],  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters

- #1: Relative motion target format:
 - "C": expressed w.r.t. current base
 - "T": expressed w.r.t. tool coordinate
 - "J": expressed in joint angles
- #2: Speed format:
 - "P": expressed as a percentage
- #3: Blending format:
 - "P": expressed as a percentage

float[] relative motion parameters. If expressed in Cartesian coordinate (w.r.t. current base or tool coordinate), it includes the relative motion value with respect to the specified coordinate: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm); If defined with joint angle, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°)

int The speed setting, expressed as a percentage (%)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

bool Disable precise positioning

- true** Disable precise positioning
- false** Enable

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP", (2) "TPP" or (3) "JPP"

```
float[] relmove = {0,0,10,45,0,0}
```

```
// Declare a float array to store the relative motion
```

```
Move_PTP("TPP",relmove,10,200,0,false)
```

target

// Move to relative motion target with PTP, velocity
= 10%, time to top speed = 200ms

Syntax 2

```
bool Move_PTP(  
    string,  
    float, float, float, float, float, float,  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters

#1: Relative motion target format:

"C": expressed w.r.t. current base

"T": expressed w.r.t. tool coordinate

"J": expressed in joint angles

#2: Speed format:

"P": expressed as a percentage

#3: Blending format:

"P": expressed as a percentage

float, float, float, float, float, float

relative motion parameters. If expressed in Cartesian coordinate (w.r.t. current base or tool coordinate), it includes the relative motion value with respect to the specified coordinate: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm); If defined with joint angle, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°)

int The speed setting, expressed as a percentage (%)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

bool Disable precise positioning

true Disable precise positioning

false Enable

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP", (2) "TPP" and (3) "JPP"

```
Move_PTP("TPP",0,0,10,45,0,0,10,200,0,false)
```

// Move 0,0,10,45,0,0, with respect to tool

coordinate, with PTP, velocity = 10%, time to top
speed = 200ms

5.6 Move_Line()

Define and send Line relative motion command into buffer for execution.

Syntax 1

```
bool Move_Line(  
    string,  
    float[],  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters

- #1: Relative motion target format:
 - "C": expressed w.r.t. current base
 - "T": expressed w.r.t. tool coordinate
- #2: Speed format:
 - "P": expressed as a percentage
 - "A": expressed in velocity (mm/s)
- #3: Blending format:
 - "P": expressed as a percentage
 - "R": expressed in radius

float[] Relative motion parameter. It includes the relative motion value with respect to the specified coordinate (current base or tool coordinate): X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm).

int The speed setting, expressed as a percentage (%) or in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%) or in radius (mm)

bool Disable precise positioning

- true** Disable precise positioning
- false** Enable

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP", (2) "CPR", (3) "CAP", (4) "CAR", (5) "TPP", (6) "TPR", (7) "TAP" and (8) "TAR"

```
float[] relmove = {0,0,10,45,0,0}
```

```
//Declare a float array to store the relative motion  
target
```

```
Move_Line("TAP",relmove,125,200,0,false)
```

```
// Move to relative motion target, with Line,  
velocity = 125mm/s, time to top speed = 200ms
```

Syntax 2

```
bool Move_Line(  
    string,  
    float, float, float, float, float, float,  
    int,  
    int,  
    int,  
    bool  
)
```

Parameters

string Definition of data format, combines three letters

#1: Relative motion target format:

"C": expressed w.r.t. current base

"T": expressed w.r.t. tool coordinate

#2: Speed format:

"P": expressed as a percentage

"A": expressed in velocity (mm/s)

#3: Blending format:

"P": expressed as a percentage

"R": expressed in radius

float, float, float, float, float, float

Relative motion parameter. It includes the relative motion value with respect to the specified coordinate (current base or tool coordinate): X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm).

int The speed setting, expressed as a percentage (%) or in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%) or in radius (mm)

bool Disable precise positioning

true Disable precise positioning

false Enable

Return

bool True Command accepted ; False Command rejected (formate error)

Note

Data format parameter includes: (1) "CPP", (2) "CPR", (3) "CAP", (4) "CAR", (5) "TPP", (6) "TPR", (7) "TAP" and (8) "TAR"

Move_Line("TAP", 0,0,10,45,0,0,125,200,0,false)

// Move to relative motion target 0,0,10,45,0,0
with Line, velocity = 125mm/s, time to top speed =
200ms.

5.7 Move_PLine()

Define and send PLine relative motion command into buffer for execution.

Syntax 1

```
bool Move_PLine (  
    string,  
    float[],  
    int,  
    int,  
    int  
)
```

Parameters

string Definition of data format, combines three letters

#1: Relative motion target format:

"C": expressed w.r.t. current base

"T": expressed w.r.t. tool coordinate

"J": expressed in joint angles

#2: Speed format:

"A" expressed in velocity (mm/s)

#3: Blending format:

"P" expressed as a percentage

float[] Relative motion parameters. If expressed in Cartesian coordinate (w.r.t. current base or tool coordinate), it includes the relative motion value with respect to the specified coordinate: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm); If defined with joint angle, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°)

int The speed setting, expressed in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

Return

bool **True** Command accepted; **False** Command rejected (formate error)

Note

Data format parameter includes: (1) "CAP", (2) "TAP" and (3) "JAP"

```
float[] target = {0,0,10,45,0,0}
```

```
// Declare a float array to store the relative motion  
target
```

```
Move_PLine("CAP",target,125,200,0)
```

```
//Move to relative motion target, with PLine, velocity =  
125mm/s, time to top speed = 200ms.
```

Syntax 2

```
bool Move_PLine(  
    string,  
    float, float, float, float, float, float,  
    int,  
    int,  
    int,  
)
```

Parameters

string Definition of data format, combines three letters

#1: Relative motion target format:

"C": expressed w.r.t. current base

"T": expressed w.r.t. tool coordinate

"J": expressed in joint angles

#2: Speed format:

"A" expressed in velocity (mm/s)

#3: Blending format:

"P" expressed as a percentage

float, float, float, float, float, float

Relative motion parameters. If expressed in Cartesian coordinate (w.r.t. current base or tool coordinate), it includes the relative motion value with respect to the specified coordinate: X (mm), Y (mm), Z (mm), RX (mm), RY (mm), RZ (mm); If defined with joint angle, it includes the angles of six joints: Joint1(°), Joint 2(°), Joint 3(°), Joint 4(°), Joint 5(°), Joint 6(°)

int The speed setting, expressed in velocity (mm/s)

int The time interval to accelerate to top speed (ms)

int Blending value, expressed as a percentage (%)

Return

bool True Command accepted ; False Command rejected (formate error)

Note

Data format parameter includes: (1) "CAP", (2) "TAP" and (3) "JAP"

Move_PLine("CAP",0,0,10,45,0,0,125,200,0)

// Move 0,0,10,45,0,0, with PLine, velocity = 125mm/s,
time to top speed = 200ms

5.8 *ChangeBase()*

Send the command of changing the base of the follow-up motions into buffer for execution.

Syntax 1

```
bool ChangeBase (  
    string  
)
```

Parameters

string Base Name

Return

bool True Command accepted; False Command rejected (formate error)

Note

```
ChangeBase("RobotBase")           // Change the base to "RobotBase", a base listed on the base list  
                                   in TMflow.
```

Syntax 2

```
bool ChangeBase (  
    float[]  
)
```

Parameters

float[] Base parameters, combines X, Y, Z, RX, RY, RZ

Return

True Command accepted; False Command rejected (formate error)

Note

```
float[] Base1 = {20,30,10,0,0,90}    // Declare a float array to store the base value  
ChangeBase(Base1)                   // Change the base value to Base1
```

Syntax 3

```
bool ChangeBase (  
    float, float, float, float, float, float  
)
```

Parameters

float, float, float, float, float, float
Base parameters, combines X, Y, Z, RX, RY, RZ

Return

`bool` `True` Command accepted; `False` Command rejected (format error)

Note

`ChangeBase(20,30,10,0,0,90)` `// Change the base value to {20,30,10,0,0,90}`

5.9 *ChangeTCP()*

Send the command of changing the TCP of the follow-up motions into buffer for execution.

Syntax 1

```
bool ChangeTCP (  
    string  
)
```

Parameters

string TCP name

Return

bool True Command accepted; False Command rejected (formate error)

Note

```
ChangeTCP("NOTOOL")           // Change the TCP to "NOTOOL", a TCP listed on the base list in TMflow.
```

Syntax 2

```
bool ChangeTCP (  
    float[]  
)
```

Parameters

float[] TCP Parameter, combines X, Y, Z, RX, RY, RZ

Return

bool True Command accepted; False Command rejected (formate error)

Note

```
float[] Tool1 = {0,0,150,0,0,90}           // Declare a float array to store the TCP value  
ChangeTCP(Tool1)                          // Change the TCP value to Tool1
```

Syntax 3

```
bool ChangeTCP (  
    float[],  
    float  
)
```

Parameters

float[] TCP Parameter, combines X, Y, Z, RX, RY, RZ

float Tool's weight

Return

`bool` `True` Command accepted; `False` Command rejected (formate error)

Note

```
float[] Tool1 = {0,0,150,0,0,90}           // Declare a float array to store the TCP value

ChangeTCP(Tool1,2)                         // Change the TCP value to Tool1 with weight = 2kg
```

Syntax 4

```
bool ChangeTCP (
    float[],
    float,
    float[]
)
```

Parameters

`float[]` TCP Parameter, combines X, Y, Z, RX, RY, RZ
`float` Tool's weight
`float[]` Tool's moment of inertia: (1)Ixx, (2)Iyy, (3)Izz and its frame of reference: (4)X, (5)Y, (6)Z, (7)RX, (8)RY, (9)RZ

Return

`bool` `True` Command accepted; `False` Command rejected (formate error)

Note

```
float[] Tool1 = {0,0,150,0,0,90}           // Declare a float array to store the TCP value

float[] COM1 = {2,0.5,0.5,0,0,-80,0,0,0}   // Declare a float array to store the moment of inertia and
                                           // its frame of reference

ChangeTCP(Tool1,2,COM1)                   // Change the TCP value to Tool1 with weight = 2kg and
                                           // moment of inertia to COM1
```

Syntax 5

```
bool ChangeTCP (
    float, float, float, float, float, float
)
```

Parameters

`float, float, float, float, float, float`
TCP Parameter, combines X, Y, Z, RX, RY, RZ

Return

`bool` `True` Command accepted; `False` Command rejected (formate error)

Note

```
ChangeTCP(0,0,150,0,0,90)                 // Change the TCP value to {0,0,150,0,0,90}
```

Syntax 6

```
bool ChangeTCP (  
    float, float, float, float, float, float,  
    float  
)
```

Parameters

float, float, float, float, float, float

TCP Parameter, combines X, Y, Z, RX, RY, RZ

float TCP weight

Return

bool True Command accepted; False Command rejected (formate error)

Note

ChangeTCP(0,0,150,0,0,90,2) // Change the TCP value to {0,0,150,0,0,90}, weight = 2kg

Syntax 7

```
bool ChangeTCP (  
    float, float, float, float, float, float,  
    float,  
    float, float, float, float, float, float, float, float, float  
)
```

Parameters

float, float, float, float, float, float

TCP Parameter, combines X, Y, Z, RX, RY, RZ

float Tool's weight

float, float, float, float, float, float, float, float, float

Tool's moment of inertia: (1)Ixx, (2)Iyy, (3)Izz and its frame of reference: (4)X, (5)Y, (6)Z, (7)RX, (8)RY, (9)RZ

Return

bool True Command accepted; False Command rejected (formate error)

Note

ChangeTCP(0,0,150,0,0,90,2, 2,0.5,0.5,0,0,-80,0,0,0) // Change the TCP value to {0,0,150,0,0,90}, weight = 2kg,
moment of inertia = {2,0.5,0.5} and frame of reference =
{0,0,-80,0,0,0}
